ESSAYS ON LIFE, ART
AND SCIENCE
Re-issue of the Works of the late
Samuel Butler

Author of "Erewhon," "The Way of All Flesh," etc.

Mr. Fifield has pleasure in announcing he has taken over the publication of the entire works (save one) of the late Samuel Butler, novelist, philosopher, scientist, satirist and classicist; "in his own department," says Mr. Bernard Shaw, "the greatest English writer of the latter half of the 19th century," "The Way of All Flesh" and "Erewhon" which have been out of print for some time are now reprinted, and all the other works with one exception are now offered at more popular prices.

Erewhon. 11th, Revised Edition. 3rd Impression. 2s. 6d. nett.
Erewhon Revisited. 2nd Impression, 340 pages. 2s. 6d. nett.
(A few copies of the original edition, gilt top, 6s.)
Essays on Life, Art and Science. 340 pages. 2s. 6d. nett.
(A few copies of the original edition, gilt top, 6s.)
The Alps and Sanctuaries of Piedmont and the Canton Ticino. Profusely illustrated by Charles Gogin, H. F. Jones and the Author. Pott 4to, cloth gilt. 10s. 6d.
The Fair Haven. 5s. nett.
Life and Habit. An essay after a completer view of Evolution. 2nd edition. 5s. nett.
Evolution Old and New. A comparison of the theories of Buffon, Erasmus Darwin and Lamarck, with that of Charles Darwin. 5s. nett.
Luck or Cunning, as the main means of organic modification. 5s. nett.
The Authoress of the Odyssey, who and what she was, when and where she wrote, etc. 5s. nett.
The Iliad of Homer, rendered into English prose. 5s. nett.
The Odyssey, rendered into English prose. 5s. nett.
Shakespeare's Sonnets, with notes and original text. 5s. nett.
Ex Voto. An account of the Sacro Monte or New Jerusalem at Varallo-Sesia. 5s. nett.
Selections from Butler's Works. 5s. nett.

London: A. C. Fifield, 44 Fleet Street, E.C.
Printed by BALLANTYNE, HANSON & Co
At the Ballantyne Press, Edinburgh.

INTRODUCTION

It is hardly necessary to apologise for the miscellaneous character of the following collection of essays. Samuel Butler was a man of such unusual versatility, and his interests were so many and so various that his literary remains were bound to cover a wide field. Nevertheless it will be found that several of the subjects to which he devoted much time and labour are not represented in these pages. I have not thought it necessary to reprint any of the numerous pamphlets and articles which he wrote upon the Iliad and Odyssey, since these were all merged in "The Authoress of the Odyssey," which gives his matured views upon everything relating to the Homeric poems. For a similar reason I have not included an essay on the evidence for the Resurrection of Jesus Christ, which he printed in 1865 for private circulation, since he subsequently made extensive use of it in "The Fair Haven."
Introduction

Two of the essays in this collection were originally delivered as lectures; the remainder were published in *The Universal Review* during 1888, 1889, and 1890.

I should perhaps explain why two other essays of his, which also appeared in *The Universal Review*, have been omitted.

The first of these, entitled "L’Affaire Holbein - Rippel," relates to a drawing of Holbein’s "Danse des Paysans," in the Basle Museum, which is usually described as a copy, but which Butler believed to be the work of Holbein himself. This essay requires to be illustrated in so elaborate a manner that it was impossible to include it in a book of this size.

The second essay, which is a sketch of the career of the sculptor Tabachetti, was published as the first section of an article entitled "A Sculptor and a Shrine," of which the second section is here given under the title, "The Sanctuary of Montrigone." The section devoted to the sculptor represents all that Butler then knew about Tabachetti, but since it was written various documents have...
come to light, principally owing to the investigations of Cavaliere Francesco Negri, of Casale Monferrato, which negative some of Butler's most cherished conclusions. Had Butler lived he would either have rewritten his essay in accordance with Cavaliere Negri's discoveries, of which he fully recognised the value, or incorporated them into the revised edition of "Ex Voto," which he intended to publish. As it stands, the essay requires so much revision that I have decided to omit it altogether, and to postpone giving English readers a full account of Tabachetti's career until a second edition of "Ex Voto" is required. Meanwhile I have given a brief summary of the main facts of Tabachetti's life in a note (page 154) to the essay on "Art in the Valley of Saas." Any one who wishes for further details of the sculptor and his work will find them in Cavaliere Negri's pamphlet, "Il Santuario di Crea" (Alessandria, 1902).

The three essays grouped together under the title of "The Deadlock in Darwinism" may be regarded as a postscript to Butler's four books on evolution, viz., "Life and
Introduction

Habit,” “Evolution, Old and New,” “Unconscious Memory” and “Luck or Cunning.” An occasion for the publication of these essays seemed to be afforded by the appearance in 1889 of Mr. Alfred Russel Wallace’s “Darwinism”; and although nearly fourteen years have elapsed since they were published in the Universal Review, I have no fear that they will be found to be out of date. How far, indeed, the problem embodied in the deadlock of which Butler speaks is from solution was conclusively shown by the correspondence which appeared in the Times in May 1903, occasioned by some remarks made at University College by Lord Kelvin in moving a vote of thanks to Professor Henslow after his lecture on “Present Day Rationalism.” Lord Kelvin’s claim for a recognition of the fact that in organic nature scientific thought is compelled to accept the idea of some kind of directive power, and his statement that biologists are coming once more to a firm acceptance of a vital principle, drew from several distinguished men of science retorts heated enough to prove beyond a doubt that
the gulf between the two main divisions of evolutionists is as wide to-day as it was when Butler wrote. It will be well, perhaps, for the benefit of readers who have not followed the history of the theory of evolution during its later developments, to state in a few words what these two main divisions are. All evolutionists agree that the differences between species are caused by the accumulation and transmission of variations, but they do not agree as to the causes to which the variations are due. The view held by the older evolutionists, Buffon, Erasmus Darwin and Lamarck, who have been followed by many modern thinkers, including Herbert Spencer and Butler, is that the variations occur mainly as the result of effort and design; the opposite view, which is that advocated by Mr. Wallace in "Darwinism," is that the variations occur merely as the result of chance. The former is sometimes called the teleological view, because it recognises the presence in organic nature of design, whether it be called creative power, directive force, directivity, or vital principle; the latter view, in
Introduction

which the existence of design is absolutely negativ ed, is now usually described as Weismannism, from the name of the writer who has been its principal advocate in recent years.

In conclusion, I must thank my friend Mr. Henry Festing Jones most warmly for the invaluable assistance which he has given me in preparing these essays for publication, in correcting the proofs, and in compiling the introduction and notes.

R. A. STREATFEILD.
ESSAYS ON LIFE, ART AND SCIENCE

QUIS DESIDERIO . . . ?

Like Mr. Wilkie Collins, I, too, have been asked to lay some of my literary experiences before the readers of the *Universal Review*. It occurred to me that the *Review* must be indeed universal before it could open its pages to one so obscure as myself; but, nothing daunted by the distinguished company among which I was for the first time asked to move, I resolved to do as I was told, and went to the British Museum to see what books I had written. Having refreshed my memory by a glance at the catalogue, I was about to try and diminish the large and ever-increasing circle of my non-readers when I became aware of a calamity that brought me to a standstill, and indeed bids fair, so far as I can

---

1 Published in the *Universal Review*, July 1888.
see at present, to put an end to my literary existence altogether.

I should explain that I cannot write unless I have a sloping desk, and the reading-room of the British Museum, where alone I can compose freely, is unprovided with sloping desks. Like every other organism, if I cannot get exactly what I want I make shift with the next thing to it; true, there are no desks in the reading-room, but, as I once heard a visitor from the country say, "it contains a large number of very interesting works." I know it was not right, and hope the Museum authorities will not be severe upon me if any of them reads this confession; but I wanted a desk, and set myself to consider which of the many very interesting works which a grateful nation places at the disposal of its would-be authors was best suited for my purpose.

For mere reading I suppose one book is pretty much as good as another; but the choice of a desk-book is a more serious matter. It must be neither too thick nor too thin; it must be large enough to make a substantial support; it must be strongly bound so as not
Art and Science

to yield or give; it must not be too troublesome to carry backwards and forwards; and it must live on shelf C, D, or E, so that there need be no stooping or reaching too high. These are the conditions which a really good book must fulfil; simple, however, as they are, it is surprising how few volumes comply with them satisfactorily; moreover, being perhaps too sensitively conscientious, I allowed another consideration to influence me, and was sincerely anxious not to take a book which would be in constant use for reference by readers, more especially as, if I did this, I might find myself disturbed by the officials.

For weeks I made experiments upon sundry poetical and philosophical works, whose names I have forgotten, but could not succeed in finding my ideal desk, until at length, more by luck than cunning, I happened to light upon Frost's "Lives of Eminent Christians," which I had no sooner tried than I discovered it to be the very perfection and ne plus ultra of everything that a book should be. It lived in Case No. 2008, and I accordingly took at once to sitting in Row B, where for
the last dozen years or so I have sat ever since.

The first thing I have done whenever I went to the Museum has been to take down Frost's "Lives of Eminent Christians" and carry it to my seat. It is not the custom of modern writers to refer to the works to which they are most deeply indebted, and I have never, that I remember, mentioned it by name before; but it is to this book alone that I have looked for support during many years of literary labour, and it is round this to me invaluable volume that all my own have page by page grown up. There is none in the Museum to which I have been under anything like such constant obligation, none which I can so ill spare, and none which I would choose so readily if I were allowed to select one single volume and keep it for my own.

On finding myself asked for a contribution to the Universal Review, I went, as I have explained, to the Museum, and presently repaired to bookcase No. 2008 to get my favourite volume. Alas! it was in the room no longer. It was not in use, for its place was filled up
Art and Science

already; besides, no one ever used it but myself. Whether the ghost of the late Mr. Frost has been so eminently unchristian as to interfere, or whether the authorities have removed the book in ignorance of the steady demand which there has been for it on the part of at least one reader, are points I cannot determine. All I know is that the book is gone, and I feel as Wordsworth is generally supposed to have felt when he became aware that Lucy was in her grave, and exclaimed so emphatically that this would make a considerable difference to him, or words to that effect.

Now I think of it, Frost's "Lives of Eminent Christians" was very like Lucy. The one resided at Dovedale in Derbyshire, the other in Great Russell Street, Bloomsbury. I admit that I do not see the resemblance here at this moment, but if I try to develop my perception I shall doubtless ere long find a marvellously striking one. In other respects, however, than mere local habitat the likeness is obvious. Lucy was not particularly attractive either inside or out —no more was Frost's "Lives of Eminent
Essays on Life

Christians”; there were few to praise her, and of those few still fewer could bring themselves to like her; indeed, Wordsworth himself seems to have been the only person who thought much about her one way or the other. In like manner, I believe I was the only reader who thought much one way or the other about Frost’s “Lives of Eminent Christians,” but this in itself was one of the attractions of the book; and as for the grief we respectively felt and feel, I believe my own to be as deep as Wordsworth’s, if not more so.

I said above, “as Wordsworth is generally supposed to have felt”; for any one imbued with the spirit of modern science will read Wordsworth’s poem with different eyes from those of a mere literary critic. He will note that Wordsworth is most careful not to explain the nature of the difference which the death of Lucy will occasion to him. He tells us that there will be a difference; but there the matter ends. The superficial reader takes it that he was very sorry she was dead; it is, of course, possible that he may have
actually been so, but he has not said this. On the contrary, he has hinted plainly that she was ugly, and generally disliked; she was only like a violet when she was half-hidden from the view, and only fair as a star when there were so few stars out that it was practically impossible to make an invidious comparison. If there were as many as even two stars the likeness was felt to be at an end. If Wordsworth had imprudently promised to marry this young person during a time when he had been unusually long in keeping to good resolutions, and had afterwards seen some one whom he liked better, then Lucy's death would undoubtedly have made a considerable difference to him, and this is all that he has ever said that it would do. What right have we to put glosses upon the masterly reticence of a poet, and credit him with feelings possibly the very reverse of those he actually entertained?

Sometimes, indeed, I have been inclined to think that a mystery is being hinted at more dark than any critic has suspected. I do not happen to possess a copy of the poem, but
the writer, if I am not mistaken, says that "few could know when Lucy ceased to be." "Ceased to be" is a suspiciously euphemistic expression, and the words "few could know" are not applicable to the ordinary peaceful death of a domestic servant such as Lucy appears to have been. No matter how obscure the deceased, any number of people commonly can know the day and hour of his or her demise, whereas in this case we are expressly told it would be impossible for them to do so. Wordsworth was nothing if not accurate, and would not have said that few could know, but that few actually did know, unless he was aware of circumstances that precluded all but those implicated in the crime of her death from knowing the precise moment of its occurrence. If Lucy was the kind of person not obscurely pourtrayed in the poem; if Wordsworth had murdered her, either by cutting her throat or smothering her, in concert, perhaps, with his friends Southey and Coleridge; and if he had thus found himself released from an engagement which had become irksome to him, or pos-
Art and Science

sibly from the threat of an action for breach of promise, then there is not a syllable in the poem with which he crowns his crime that is not alive with meaning. On any other supposition to the general reader it is unintelligible.

We cannot be too guarded in the interpretations we put upon the words of great poets. Take the young lady who never loved the dear gazelle—and I don’t believe she did; we are apt to think that Moore intended us to see in this creation of his fancy a sweet, amiable, but most unfortunate young woman, whereas all he has told us about her points to an exactly opposite conclusion. In reality, he wished us to see a young lady who had been an habitual complainer from her earliest childhood; whose plants had always died as soon as she bought them, while those belonging to her neighbours had flourished. The inference is obvious, nor can we reasonably doubt that Moore intended us to draw it; if her plants were the very first to fade away, she was evidently the very first to neglect or otherwise maltreat them. She did not give
them enough water, or left the door of her fern-case open when she was cooking her dinner at the gas stove, or kept them too near the paraffin oil, or other like folly; and as for her temper, see what the gazelles did; as long as they did not know her "well," they could just manage to exist, but when they got to understand her real character, one after another felt that death was the only course open to it, and accordingly died rather than live with such a mistress. True, the young lady herself said the gazelles loved her; but disagreeable people are apt to think themselves amiable, and in view of the course invariably taken by the gazelles themselves any one accustomed to weigh evidence will hold that she was probably mistaken.

I must, however, return to Frost's "Lives of Eminent Christians." I will leave none of the ambiguity about my words in which Moore and Wordsworth seem to have delighted. I am very sorry the book is gone, and know not where to turn for its successor. Till I have found a substitute I can write no more, and I do not know how to find even
Art and Science

a tolerable one. I should try a volume of Migne's "Complete Course of Patrology," but I do not like books in more than one volume, for the volumes vary in thickness, and one never can remember which one took; the four volumes, however, of Bede in Giles's "Anglican Fathers" are not open to this objection, and I have reserved them for favourable consideration. Mather's "Magnalia" might do, but the binding does not please me; Cureton's "Corpus Ignatianum" might also do if it were not too thin. I do not like taking Norton's "Genuineness of the Gospels," as it is just possible some one may be wanting to know whether the Gospels are genuine or not, and be unable to find out because I have got Mr. Norton's book. Baxter's "Church History of England," Lingard's "Anglo-Saxon Church," and Cardwell's "Documentary Annals," though none of them as good as Frost, are works of considerable merit; but on the whole I think Arvine's "Cyclopedia of Moral and Religious Anecdote" is perhaps the one book in the room which comes within measurable
distance of Frost. I should probably try this book first, but it has a fatal objection in its too seductive title. "I am not curious," as Miss Lottie Venne says in one of her parts, "but I like to know," and I might be tempted to pervert the book from its natural uses and open it, so as to find out what kind of a thing a moral and religious anecdote is. I know, of course, that there are a great many anecdotes in the Bible, but no one thinks of calling them either moral or religious, though some of them certainly seem as if they might fairly find a place in Mr. Arvine's work. There are some things, however, which it is better not to know, and take it all round I do not think I should be wise in putting myself in the way of temptation, and adopting Arvine as the successor to my beloved and lamented Frost.

Some successor I must find, or I must give up writing altogether, and this I should be sorry to do. I have only as yet written about a third, or from that—counting works written but not published—to a half, of the books which I have set myself to write. It would not so much matter if old age was not staring
me in the face. Dr. Parr said it was "a beastly shame for an old man not to have laid down a good cellar of port in his youth"; I, like the greater number, I suppose, of those who write books at all, write in order that I may have something to read in my old age when I can write no longer. I know what I shall like better than any one can tell me, and write accordingly; if my career is nipped in the bud, as seems only too likely, I really do not know where else I can turn for present agreeable occupation, nor yet how to make suitable provision for my later years. Other writers can, of course, make excellent provision for their own old ages, but they cannot do so for mine, any more than I should succeed if I were to try to cater for theirs. It is one of those cases in which no man can make agreement for his brother.

I have no heart for continuing this article, and if I had, I have nothing of interest to say. No one's literary career can have been smoother or more unchequered than mine. I have published all my books at my own expense, and paid for them in due course.
Essays on Life

What can be conceivably more unromantic? For some years I had a little literary grievance against the authorities of the British Museum because they would insist on saying in their catalogue that I had published three sermons on Infidelity in the year 1820. I thought I had not, and got them out to see. They were rather funny, but they were not mine. Now, however, this grievance has been removed. I had another little quarrel with them because they would describe me as "of St. John's College, Cambridge," an establishment for which I have the most profound veneration, but with which I have not had the honour to be connected for some quarter of a century. At last they said they would change this description if I would only tell them what I was, for, though they had done their best to find out, they had themselves failed. I replied with modest pride that I was a Bachelor of Arts. I keep all my other letters inside my name, not outside. They mused and said it was unfortunate that I was not a Master of Arts. Could I not get myself made a Master? I said I understood that a Master-
ship was an article the University could not do under about five pounds, and that I was not disposed to go sixpence higher than three ten. They again said it was a pity, for it would be very inconvenient to them if I did not keep to something between a bishop and a poet. I might be anything I liked in reason, provided I showed proper respect for the alphabet; but they had got me between "Samuel Butler, bishop," and "Samuel Butler, poet." It would be very troublesome to shift me, and bachelor came before bishop. This was reasonable, so I replied that, under those circumstances, if they pleased, I thought I would like to be a philosophical writer. They embraced the solution, and, no matter what I write now, I must remain a philosophical writer as long as I live, for the alphabet will hardly be altered in my time, and I must be something between "Bis" and "Poe." If I could get a volume of my excellent namesake's "Hudibras" out of the list of my works, I should be robbed of my last shred of literary grievance, so I say nothing about this, but keep it secret, lest some
Essays on Life

worse thing should happen to me. Besides, I have a great respect for my namesake, and always say that if "Erewhon" had been a racehorse it would have been got by "Hudibras" out of "Analogy." Some one said this to me many years ago, and I felt so much flattered that I have been repeating the remark as my own ever since.

But how small are these grievances as compared with those endured without a murmur by hundreds of writers far more deserving than myself. When I see the scores and hundreds of workers in the reading-room who have done so much more than I have, but whose work is absolutely fruitless to themselves, and when I think of the prompt recognition obtained by my own work, I ask myself what I have done to be thus rewarded. On the other hand, the feeling that I have succeeded far beyond my deserts hitherto, makes it all the harder for me to acquiesce without complaint in the extinction of a career which I honestly believe to be a promising one; and once more I repeat that, unless the Museum authorities give me back
Art and Science

my Frost, or put a locked clasp on Arvine, my career must be extinguished. Give me back Frost, and, if life and health are spared, I will write another dozen of volumes yet before I hang up my fiddle—if so serious a confusion of metaphors may be pardoned. I know from long experience how kind and considerate both the late and present superintendents of the reading-room were and are, but I doubt how far either of them would be disposed to help me on this occasion; continue, however, to rob me of my Frost, and, whatever else I may do, I will write no more books.

Note by Dr. Garnett, British Museum.—The frost has broken up. Mr. Butler is restored to literature. Mr. Mudie may make himself easy. England will still boast a humourist; and the late Mr. Darwin (to whose posthumous machinations the removal of the book was owing) will continue to be confounded.—R. Garnett.
RAMBLINGS IN CHEAPSIDE

Walking the other day in Cheapside I saw some turtles in Mr. Sweeting’s window, and was tempted to stay and look at them. As I did so I was struck not more by the defences with which they were hedged about, than by the fatuousness of trying to hedge that in at all which, if hedged thoroughly, must die of its own defencesfulness. The holes for the head and feet through which the turtle leaks out, as it were, on to the exterior world, and through which it again absorbs the exterior world into itself—“catching on” through them to things that are thus both turtle and not turtle at one and the same time—these holes stultify the armour, and show it to have been designed by a creature with more of faithfulness to a fixed idea, and hence one-sidedness, than of that quick sense of relative importances and their changes, which is the main factor of good living.

1 Published in the Universal Review, December 1890.
Art and Science

The turtle obviously had no sense of proportion; it differed so widely from myself that I could not comprehend it; and as this word occurred to me, it occurred also that until my body comprehended its body in a physical material sense, neither would my mind be able to comprehend its mind with any thoroughness. For unity of mind can only be consummated by unity of body; everything, therefore, must be in some respects both knave and fool to all that which has not eaten it, or by which it has not been eaten. As long as the turtle was in the window and I in the street outside, there was no chance of our comprehending one another.

Nevertheless I knew that I could get it to agree with me if I could so effectually button-hole and fasten on to it as to eat it. Most men have an easy method with turtle soup, and I had no misgiving but that if I could bring my first premise to bear I should prove the better reasoner. My difficulty lay in this initial process, for I had not with me the argument that would alone compel Mr. Sweeting to think that I ought to be allowed to
convert the turtles—I mean I had no money in my pocket. No missionary enterprise can be carried on without any money at all, but even so small a sum as half-a-crown would, I suppose, have enabled me to bring the turtle partly round, and with many half-crowns I could in time no doubt convert the lot, for the turtle needs must go where the money drives. If, as is alleged, the world stands on a turtle, the turtle stands on money. No money no turtle. As for money, that stands on opinion, credit, trust, faith—things that, though highly material in connection with money, are still of immaterial essence.

The steps are perfectly plain. The men who caught the turtles brought a fairly strong and definite opinion to bear upon them, that passed into action, and later on into money. They thought the turtles would come that way, and verified their opinion; on this, will and action were generated, with the result that the men turned the turtles on their backs and carried them off. Mr. Sweeting touched these men with money, which is the outward and visible sign of verified opinion. The customer
Art and Science

touches Mr. Sweeting with money, Mr. Sweeting touches the waiter and the cook with money. They touch the turtle with skill and verified opinion. Finally, the customer applies the clinching argument that brushes all sophisms aside, and bids the turtle stand protoplasm to protoplasm with himself, to know even as it is known.

But it must be all touch, touch, touch; skill, opinion, power, and money, passing in and out with one another in any order we like, but still link to link and touch to touch. If there is failure anywhere in respect of opinion, skill, power, or money, either as regards quantity or quality, the chain can be no stronger than its weakest link, and the turtle and the clinching argument will fly asunder. Of course, if there is an initial failure in connection, through defect in any member of the chain, or of connection between the links, it will no more be attempted to bring the turtle and the clinching argument together, than it will to chain up a dog with two pieces of broken chain that are disconnected. The contact throughout must be conceived as
absolute; and yet perfect contact is inconceivable by us, for on becoming perfect it ceases to be contact, and becomes essential, once for all inseverable, identity. The most absolute contact short of this is still contact by courtesy only. So here, as everywhere else, Eurydice glides off as we are about to grasp her. We can see nothing face to face; our utmost seeing is but a fumbling of blind finger-ends in an overcrowded pocket.

Presently my own blind finger-ends fished up the conclusion, that as I had neither time nor money to spend on perfecting the chain that would put me in full spiritual contact with Mr. Sweeting's turtles, I had better leave them to complete their education at some one else's expense rather than mine, so I walked on towards the Bank. As I did so it struck me how continually we are met by this melting of one existence into another. The limits of the body seem well defined enough as definitions go, but definitions seldom go far. What, for example, can seem more distinct from a man than his banker or his solicitor? Yet these are commonly so much parts of him
that he can no more cut them off and grow new ones, than he can grow new legs or arms; neither must he wound his solicitor; a wound in the solicitor is a very serious thing. As for his bank—failure of his bank's action may be as fatal to a man as failure of his heart. I have said nothing about the medical or spiritual adviser, but most men grow into the society that surrounds them by the help of these four main tap-roots, and not only into the world of humanity, but into the universe at large. We can, indeed, grow butchers, bakers, and greengrocers, almost ad libitum, but these are low developments, and correspond to skin, hair, or finger-nails. Those of us again who are not highly enough organised to have grown a solicitor or banker can generally repair the loss of whatever social organisation they may possess as freely as lizards are said to grow new tails; but this with the higher social, as well as organic, developments is only possible to a very limited extent.

The doctrine of metempsychosis, or transmigration of souls—a doctrine to which the foregoing considerations are for the most part
easy corollaries—crops up no matter in what direction we allow our thoughts to wander. And we meet instances of transmigration of body as well as of soul. I do not mean that both body and soul have transmigrated together, far from it; but that, as we can often recognise a transmigrated mind in an alien body, so we not less often see a body that is clearly only a transmigration, linked on to some one else’s new and alien soul. We meet people every day whose bodies are evidently those of men and women long dead, but whose appearance we know through their portraits. We see them going about in omnibuses, railway carriages, and in all public places. The cards have been shuffled, and they have drawn fresh lots in life and nationalities, but any one fairly well up in mediæval and last century portraiture knows them at a glance.

Going down once towards Italy I saw a young man in the train whom I recognised, only he seemed to have got younger. He was with a friend, and his face was in continual play, but for some little time I puzzled in vain to recollect where it was that I had seen him
Art and Science

before. All of a sudden I remembered he was King Francis I. of France. I had hitherto thought the face of this king impossible, but when I saw it in play I understood it. His great contemporary Henry VIII. keeps a restaurant in Oxford Street. Falstaff drove one of the St. Gothard diligences for many years, and only retired when the railway was opened. Titian once made me a pair of boots at Vicenza, and not very good ones. At Modena I had my hair cut by a young man whom I perceived to be Raffaelle. The model who sat to him for his celebrated Madonnas is first lady in a confectionery establishment at Montreal. She has a little motherly pimple on the left side of her nose that is misleading at first, but on examination she is readily recognised; probably Raffaelle’s model had the pimple too, but Raffaelle left it out—as he would.

Handel, of course, is Madame Patey. Give Madame Patey Handel’s wig and clothes, and there would be no telling her from Handel. It is not only that the features and the shape of the head are the same, but there is a certain
imperiousness of expression and attitude about Handel which he hardly attempts to conceal in Madame Patey. It is a curious coincidence that he should continue to be such an incomparable renderer of his own music. Pope Julius II. was the late Mr. Darwin. Rameses II. is a blind woman now, and stands in Holborn, holding a tin mug. I never could understand why I always found myself humming "They oppressed them with burthens" when I passed her, till one day I was looking in Mr. Spooner's window in the Strand, and saw a photograph of Rameses II. Mary Queen of Scots wears surgical boots and is subject to fits, near the Horse Shoe in Tottenham Court Road.

Michael Angelo is a commissionaire; I saw him on board the Glen Rosa, which used to run every day from London to Clacton-on-Sea and back. It gave me quite a turn when I saw him coming down the stairs from the upper deck, with his bronzed face, flattened nose, and with the familiar bar upon his forehead. I never liked Michael Angelo, and never shall, but I am afraid of him, and was
near trying to hide when I saw him coming towards me. He had not got his commis-
sionaire's uniform on, and I did not know he was one till I met him a month or so later in
the Strand. When we got to Blackwall the music struck up and people began to dance.
I never saw a man dance so much in my life. He did not miss a dance all the way to
Clacton, nor all the way back again, and when not dancing he was flirting and cracking
jokes. I could hardly believe my eyes when I reflected that this man had painted the famous
"Last Judgment," and had made all those statues.

Dante is, or was a year or two ago, a waiter at Brissago on the Lago Maggiore, only he is
better-tempered-looking, and has a more in-
tellectual expression. He gave me his ideas
upon beauty: "Tutto ch'è vero è bello," he
exclaimed, with all his old self-confidence. I
am not afraid of Dante. I know people by
their friends, and he went about with Virgil,
so I said with some severity, "No, Dante, il
nasso della Signora Robinson è vero, ma non
è bello"; and he admitted I was right.
Beatrice's name is Towler; she is waitress at a small inn in German Switzerland. I used to sit at my window and hear people call "Towler, Towler, Towler," fifty times in a forenoon. She was the exact antithesis to Abra; Abra, if I remember, used to come before they called her name, but no matter how often they called Towler, every one came before she did. I suppose they spelt her name Taula, but to me it sounded Towler; I never, however, met any one else with this name. She was a sweet, artless little hussy, who made me play the piano to her, and she said it was lovely. Of course I only played my own compositions; so I believed her, and it all went off very nicely. I thought it might save trouble if I did not tell her who she really was, so I said nothing about it.

I met Socrates once. He was my muleteer on an excursion which I will not name, for fear it should identify the man. The moment I saw my guide I knew he was somebody, but for the life of me I could not remember who. All of a sudden it flashed across me that he was Socrates. He talked enough for
six, but it was all in dialetto, so I could not understand him, nor, when I had discovered who he was, did I much try to do so. He was a good creature, a trifle given to stealing fruit and vegetables, but an amiable man enough. He had had a long day with his mule and me, and he only asked me five francs. I gave him ten, for I pitied his poor old patched boots, and there was a meekness about him that touched me. "And now, Socrates," said I at parting, "we go on our several ways, you to steal tomatoes, I to filch ideas from other people; for the rest—which of these two roads will be the better going, our father which is in heaven knows, but we know not."

I have never seen Mendelssohn, but there is a fresco of him on the terrace, or open-air dining-room, of an inn at Chiavenna. He is not called Mendelssohn, but I knew him by his legs. He is in the costume of a dandy of some five-and-forty years ago, is smoking a cigar, and appears to be making an offer of marriage to his cook. Beethoven both my friend Mr. H. Festing Jones and I have had the good
fortune to meet; he is an engineer now, and does not know one note from another; he has quite lost his deafness, is married, and is, of course, a little squat man with the same refractory hair that he always had. It was very interesting to watch him, and Jones remarked that before the end of dinner he had become positively posthumous. One morning I was told the Beethovens were going away, and before long I met their two heavy boxes being carried down the stairs. The boxes were so squab and like their owners, that I half thought for a moment that they were inside, and should hardly have been surprised to see them spring up like a couple of Jacks-in-the-box. "Sono indentro?" said I, with a frown of wonder, pointing to the boxes. The porters knew what I meant, and laughed. But there is no end to the list of people whom I have been able to recognise, and before I had got through it myself, I found I had walked some distance, and had involuntarily paused in front of a second-hand bookstall.

I do not like books. I believe I have the smallest library of any literary man in London,
Art and Science

and I have no wish to increase it. I keep my books at the British Museum and at Mudie's, and it makes me very angry if any one gives me one for my private library. I once heard two ladies disputing in a railway carriage as to whether one of them had or had not been wasting money. "I spent it in books," said the accused, "and it's not wasting money to buy books." "Indeed, my dear, I think it is," was the rejoinder, and in practice I agree with it. Webster's Dictionary, Whitaker's Almanack, and Bradshaw's Railway Guide should be sufficient for any ordinary library; it will be time enough to go beyond these when the mass of useful and entertaining matter which they provide has been mastered. Nevertheless, I admit that sometimes, if not particularly busy, I stop at a second-hand bookstall and turn over a book or two from mere force of habit.

I know not what made me pick up a copy of Æschylus—of course in an English version—or rather I know not what made Æschylus take up with me, for he took me rather than I him; but no sooner had he got
Essays on Life

me than he began puzzling me, as he has done any time this forty years, to know wherein his transcendent merit can be supposed to lie. To me he is, like the greater number of classics in all ages and countries, a literary Struldbrug, rather than a true ambrosia-fed immortal. There are true immortals, but they are few and far between; most classics are as great impostors dead as they were when living, and while posing as gods are, five-sevenths of them, only Struldbrugs. It comforts me to remember that Aristophanes liked Æschylus no better than I do. True, he praises him by comparison with Sophocles and Euripides, but he only does so that he may run down these last more effectively. Aristophanes is a safe man to follow, nor do I see why it should not be as correct to laugh with him as to pull a long face with the Greek Professors; but this is neither here nor there, for no one really cares about Æschylus; the more interesting question is how he contrived to make so many people for so many years pretend to care about him.

Perhaps he married somebody's daughter.
Art and Science

If a man would get hold of the public ear, he must pay, marry, or fight. I have never understood that Æschylus was a man of means, and the fighters do not write poetry, so I suppose he must have married a theatrical manager's daughter, and got his plays brought out that way. The ear of any age or country is like its land, air, and water; it seems limitless but is really limited, and is already in the keeping of those who naturally enough will have no squatting on such valuable property. It is written and talked up to as closely as the means of subsistence are bred up to by a teeming population. There is not a square inch of it but is in private hands, and he who would freehold any part of it must do so by purchase, marriage, or fighting, in the usual way—and fighting gives the longest, safest tenure. The public itself has hardly more voice in the question who shall have its ear, than the land has in choosing its owners. It is farmed as those who own it think most profitable to themselves, and small blame to them; nevertheless, it has a residuum of mulishness which the land has not, and does
Essays on Life

sometimes dispossess its tenants. It is in this residuum that those who fight place their hope and trust.

Or perhaps Æschylus squared the leading critics of his time. When one comes to think of it, he must have done so, for how is it conceivable that such plays should have had such runs if he had not? I met a lady one year in Switzerland who had some parrots that always travelled with her and were the idols of her life. These parrots would not let any one read aloud in their presence, unless they heard their own names introduced from time to time. If these were freely interpolated into the text they would remain as still as stones, for they thought the reading was about themselves. If it was not about them it could not be allowed. The leaders of literature are like these parrots; they do not look at what a man writes, nor if they did would they understand it much better than the parrots do; but they like the sound of their own names, and if these are freely interpolated in a tone they take as friendly, they may even give ear to an outsider. Otherwise they will scream him off if they can.
Art and Science

I should not advise any one with ordinary independence of mind to attempt the public ear unless he is confident that he can out-lung and out-last his own generation; for if he has any force, people will and ought to be on their guard against him, inasmuch as there is no knowing where he may not take them. Besides, they have staked their money on the wrong men so often without suspecting it, that when there comes one whom they do suspect it would be madness not to bet against him. True, he may die before he has out-screamed his opponents, but that has nothing to do with it. If his scream was well pitched it will sound clearer when he is dead. We do not know what death is. If we know so little about life which we have experienced, how shall we know about death which we have not —and in the nature of things never can? Every one, as I said years ago in "Alps and Sanctuaries," is an immortal to himself, for he cannot know that he is dead until he is dead, and when dead how can he know anything about anything? All we know is, that even the humblest dead may live long after all
trace of the body has disappeared; we see them doing it in the bodies and memories of those that come after them; and not a few live so much longer and more effectually than is desirable, that it has been necessary to get rid of them by Act of Parliament. It is love that alone gives life, and the truest life is that which we live not in ourselves but vicariously in others, and with which we have no concern. Our concern is so to order ourselves that we may be of the number of them that enter into life,—although we know it not.

Æschylus did so order himself; but his life is not of that inspiriting kind that can be won through fighting the good fight only—or being believed to have fought it. His voice is the echo of a drone, drone-begotten and drone-sustained. It is not a tone that a man must utter or die—nay, even though he die; and likely enough half the allusions and hard passages in Æschylus of which we can make neither head nor tail are in reality only puffs of some of the literary leaders of his time.
The lady above referred to told me more about her parrots. She was like a Nasmyth's hammer going slow—very gentle, but irresistible. She always read the newspaper to them. What was the use of having a newspaper if one did not read it to one's parrots?

"And have you divined," I asked, "to which side they incline in politics?"

"They do not like Mr. Gladstone," was the somewhat freezing answer; "this is the only point on which we disagree, for I adore him. Don't ask more about this, it is a great grief to me. I tell them everything," she continued, "and hide no secret from them."

"But can any parrot be trusted to keep a secret?"

"Mine can."

"And on Sundays do you give them the same course of reading as on a week-day, or do you make a difference?"

"On Sundays I always read them a genealogical chapter from the Old or New Testament, for I can thus introduce their names
Essays on Life

without profanity. I always keep tea by me in case they should ask for it in the night, and I have an Etna to warm it for them; they take milk and sugar. The old white-headed clergyman came to see them last night; it was very painful, for Jocko reminded him so strongly of his late . . .

I thought she was going to say "wife," but it proved to have been only of a parrot that he had once known and loved.

One evening she was in difficulties about the quarantine, which was enforced that year on the Italian frontier. The local doctor had gone down that morning to see the Italian doctor and arrange some details. "Then, perhaps, my dear," she said to her husband, "he is the quarantine." "No, my love," replied her husband. "The quarantine is not a person, it is a place where they put people"; but she would not be comforted, and suspected the quarantine as an enemy that might at any moment pounce out upon her and her parrots. So a lady told me once that she had been in like trouble about the anthem. She read in her prayer-book that in choirs and places
where they sing “here followeth the anthem,” yet the person with this most mysteriously sounding name never did follow. They had a choir, and no one could say the church was not a place where they sang, for they did sing—both chants and hymns. Why, then, this persistent slackness on the part of the anthem, who at this juncture should follow her papa, the rector, into the reading-desk? No doubt he would come some day, and then what would he be like? Fair or dark? Tall or short? Would he be bald and wear spectacles like papa, or would he be young and good-looking? Anyhow, there was something wrong, for it was announced that he would follow, and he never did follow; therefore there was no knowing what he might not do next.

I heard of the parrots a year or two later as giving lessons in Italian to an English maid. I do not know what their terms were. Alas! since then both they and their mistress have joined the majority. When the poor lady felt her end was near she desired (and the responsibility for this must rest with her, not me) that the birds might be destroyed, as
fearing that they might come to be neglected, and knowing that they could never be loved again as she had loved them. On being told that all was over, she said, "Thank you," and immediately expired.

Reflecting in such random fashion, and strolling with no greater method, I worked my way back through Cheapside and found myself once more in front of Sweeting's window. Again the turtles attracted me. They were alive, and so far at any rate they agreed with me. Nay, they had eyes, mouths, legs, if not arms, and feet, so there was much in which we were both of a mind, but surely they must be mistaken in arming themselves so very heavily. Any creature on getting what the turtle aimed at would overreach itself and be landed not in safety but annihilation. It should have no communion with the outside world at all, for death could creep in wherever the creature could creep out; and it must creep out somewhere if it was to hook on to outside things. What death can be more absolute than such absolute isolation? Perfect death, indeed, if it were attainable
Art and Science

(which it is not), is as near perfect security as we can reach, but it is not the kind of security aimed at by any animal that is at the pains of defending itself. For such want to have things both ways, desiring the livingness of life without its perils, and the safety of death without its deadness, and some of us do actually get this for a considerable time, but we do not get it by plating ourselves with armour as the turtle does. We tried this in the Middle Ages, and no longer mock ourselves with the weight of armour that our forefathers carried in battle. Indeed the more deadly the weapons of attack become the more we go into the fight slug-wise.

Slugs have ridden their contempt for defensive armour as much to death as the turtles their pursuit of it. They have hardly more than skin enough to hold themselves together; they court death every time they cross the road. Yet death comes not to them more than to the turtle, whose defences are so great that there is little left inside to be defended. Moreover, the slugs fare best in the long run, for turtles are dying out, while
slugs are not, and there must be millions of slugs all the world over for every single turtle. Of the two vanities, therefore, that of the slug seems most substantial.

In either case the creature thinks itself safe, but is sure to be found out sooner or later; nor is it easy to explain this mockery save by reflecting that everything must have its meat in due season, and that meat can only be found for such a multitude of mouths by giving everything as meat in due season to something else. This is like the Kilkenny cats, or robbing Peter to pay Paul; but it is the way of the world, and as every animal must contribute in kind to the picnic of the universe, one does not see what better arrangement could be made than the providing each race with a hereditary fallacy, which shall in the end get it into a scrape, but which shall generally stand the wear and tear of life for some time. "Do ut des" is the writing on all flesh to him that eats it; and no creature is dearer to itself than it is to some other that would devour it.

Nor is there any statement or proposition
Art and Science

more invulnerable than living forms are. Propositions prey upon and are grounded upon one another just like living forms. They support one another as plants and animals do; they are based ultimately on credit, or faith, rather than the cash of irrefragable conviction. The whole universe is carried on on the credit system, and if the mutual confidence on which it is based were to collapse, it must itself collapse immediately. Just or unjust, it lives by faith; it is based on vague and impalpable opinion that by some inscrutable process passes into will and action, and is made manifest in matter and in flesh: it is meteoric—suspended in mid-air; it is the baseless fabric of a vision so vast, so vivid, and so gorgeous that no base can seem more broad than such stupendous baselessness, and yet any man can bring it about his ears by being over-curious; when faith fails a system based on faith fails also.

Whether the universe is really a paying concern, or whether it is an inflated bubble that must burst sooner or later, this is another matter. If people were to demand cash payment in irrefragable certainty for everything
that they have taken hitherto as paper money on the credit of the bank of public opinion, is there money enough behind it all to stand so great a drain even on so great a reserve? Probably there is not, but happily there can be no such panic, for even though the cultured classes may do so, the uncultured are too dull to have brains enough to commit such stupendous folly. It takes a long course of academic training to educate a man up to the standard which he must reach before he can entertain such questions seriously, and by a merciful dispensation of Providence, university training is almost as costly as it is unprofitable. The majority will thus be always unable to afford it, and will base their opinions on mother wit and current opinion rather than on demonstration.

So I turned my steps homewards; I saw a good many more things on my way home, but I was told that I was not to see more this time than I could get into twelve pages of the Universal Review; I must therefore reserve any remark which I think might perhaps entertain the reader for another occasion.
THE AUNT, THE NIECES, AND
THE DOG

When a thing is old, broken, and useless we throw it on the dust-heap, but when it is sufficiently old, sufficiently broken, and sufficiently useless we give money for it, put it into a museum, and read papers over it which people come long distances to hear. By-and-by, when the whirligig of time has brought on another revenge, the museum itself becomes a dust-heap, and remains so till after long ages it is re-discovered, and valued as belonging to a neo-rubbish age—containing, perhaps, traces of a still older paleo-rubbish civilisation. So when people are old, indigent, and in all respects incapable, we hold them in greater and greater contempt as their poverty and impotence increase, till they reach the pitch when

1 Published in the Universal Review, May 1889. As I have several times been asked if the letters here reprinted were not fabricated by Butler himself, I take this opportunity of stating that they are authentic in every particular, and that the originals are now in my possession.—R. A. S.
they are actually at the point to die, whereon they become sublime. Then we place every resource our hospitals can command at their disposal, and show no stint in our consideration for them.

It is the same with all our interests. We care most about extremes of importance and of unimportance; but extremes of importance are tainted with fear, and a very imperfect fear casteth out love. Extremes of unimportance cannot hurt us, therefore we are well disposed towards them; the means may come to do so, therefore we do not love them. Hence we pick a fly out of a milk-jug and watch with pleasure over its recovery, for we are confident that under no conceivable circumstances will it want to borrow money from us; but we feel less sure about a mouse, so we show it no quarter. The compilers of our almanacs well know this tendency of our natures, so they tell us, not when Noah went into the ark, nor when the temple of Jerusalem was dedicated, but that Lindley Murray, grammarian, died January 16, 1826. This is not because they could not find so many as three hundred and
Art and Science

sixty-five events of considerable interest since the creation of the world, but because they well know we would rather hear of something less interesting. We care most about what concerns us either very closely, or so little that practically we have nothing whatever to do with it.

I once asked a young Italian, who professed to have a considerable knowledge of English literature, which of all our poems pleased him best. He replied without a moment's hesitation:

"Hey diddle diddle, the cat and the fiddle,
The cow jumped over the moon;
The little dog laughed to see such sport,
And the dish ran away with the spoon."

He said this was better than anything in Italian. They had Dante and Tasso, and ever so many more great poets, but they had nothing comparable to "Hey diddle diddle," nor had he been able to conceive how any one could have written it. Did I know the author's name, and had we given him a statue? On this I told him of the young lady of Harrow who would go to church in a barrow,
and plied him with whatever rhyming nonsense I could call to mind, but it was no use; all of these things had an element of reality that robbed them of half their charm, whereas "Hey diddle diddle" had nothing in it that could conceivably concern him.

So again it is with the things that gall us most. What is it that rises up against us at odd times and smites us in the face again and again for years after it has happened? That we spent all the best years of our life in learning what we have found to be a swindle, and to have been known to be a swindle by those who took money for misleading us? That those on whom we most leaned most betrayed us? That we have only come to feel our strength when there is little strength left of any kind to feel? These things will hardly much disturb a man of ordinary good temper. But that he should have said this or that little unkind and wanton saying; that he should have gone away from this or that hotel and given a shilling too little to the waiter; that his clothes were shabby at such or such a garden-party—these things gall us as a corn
Art and Science

will sometimes do, though the loss of a limb may not be seriously felt.

I have been reminded lately of these considerations with more than common force by reading the very voluminous correspondence left by my grandfather, Dr. Butler, of Shrewsbury, whose memoirs I am engaged in writing. I have found a large number of interesting letters on subjects of serious import, but must confess that it is to the hardly less numerous lighter letters that I have been most attracted, nor do I feel sure that my eminent namesake did not share my predilection. Among other letters in my possession I have one bundle that has been kept apart, and has evidently no connection with Dr. Butler's own life. I cannot use these letters, therefore, for my book, but over and above the charm of their inspired spelling, I find them of such an extremely trivial nature that I incline to hope the reader may derive as much amusement from them as I have done myself, and venture to give them the publicity here which I must refuse them in my book. The dates and signatures have, with the exception of
Mrs. Newton's, been carefully erased, but I have collected that they were written by the two servants of a single lady who resided at no great distance from London, to two nieces of the said lady who lived in London itself. The aunt never writes, but always gets one of the servants to do so for her. She appears either as "your aunt" or as "She"; her name is not given, but she is evidently looked upon with a good deal of awe by all who had to do with her.

The letters almost all of them relate to visits either of the aunt to London, or of the nieces to the aunt's home, which, from occasional allusions to hopping, I gather to have been in Kent, Sussex, or Surrey. I have arranged them to the best of my power, and take the following to be the earliest. It has no signature, but is not in the handwriting of the servant who styles herself Elizabeth, or Mrs. Newton. It runs:

"Madam,—Your Aunt Wishes me to inform you she will be glad if you will let hir know if you think of coming To hir House
Art and Science

thiss month or Next as she cannot have you in September on a kount of the Hoping If you ar coming she thinkes she had batter Go to London on the Day you com to hir House she says you shall have every Thing raddy for you at hir House and Mrs. Newton to meet you and stay with you till She returns a gann.

"if you arnot Coming thiss Summer She will be in London before thiss Month is out and will Sleep on the Sofy As She willnot be in London more thann two nits. and She Says she willnot truble you on any a kount as She Will returne the Same Day before She will plage you any more. but She thanks you for asking hir to London. but She says She cannot leve the house at prassant She sayhir Survants ar to do for you as she cannot lodge yours nor she willnot have thim in at the house any more to brake and destroy hir thinks and beslive hir and make up Lies by hir and Skandel as your too did She says she mens to pay fore 2 Nits and one day, She says the Pepelwill let hir have it if you ask thim to let hir: you Will be so good as to
let hir know sun: wish She is to do, as She says She dos not care anny thing a bout it. which way tiss she is batter than She was and desirs hir Love to bouth bouth.

"Your aunt wises to know how the silk Clocks ar madup [how the silk cloaks are made up] with a Cape or a wood as she is a goin to have one madeup to rideout in in hir littel shas [chaise].

"Charles is a butty and so good.

"Mr & Mrs Newton ar quite wall & desires to be remembered to you."

I can throw no light on the meaning of the verb to "beslive." Each letter in the MS. is so admirably formed that there can be no question about the word being as I have given it. Nor have I been able to discover what is referred to by the words "Charles is a butty and so good." We shall presently meet with a Charles who "flies in the Fier," but that Charles appears to have been in London, whereas this one is evidently in Kent, or wherever the aunt lived.
The next letter is from Mrs. Newton:

"Der Miss——, I receive your letter your aunt is vary ill and lowspireted I donte think your aunt wood git up all day if my sister was not to persage her we all think hir lif is two monopolous. you wish to know who was liveing with your aunt. that is my sister and willian—— and cariline—— as cock and old poll pepper is come to stay with her a littel while and I hoped [hopped] for your aunt, and harry has worked for your aunt all the summer. your aunt and harry whent to the wells races and spent a very pleasant day your aunt has lost old fanney sow she died about a week a go harry he wanted your aunt to have her killed and send her to london and shee wold fech her £11 the farmers have lost a greet deal of cattel such as hogs and cows what theay call the plage I whent to your aunt as you wish mee to do but she told mee she did not wont aney boddy she told mee she should like to come up to see you but she
Essays on Life

Cant Come know for she is Boddyley ill and Harry Dontie Work there know But he Go up there Once in Two or Three Day Harry Offered is self to Go up to Live With your Aunt But She Made him know Ancer. I hav Been up to your Aunt at Work for 5 Weeks Hopping and Ragluting Your Aunt Dontie Eat nor Drink But vary Littel indeed.

"I am Happy to Say We are Both Quite Well and I am Glad no hear you are Both Quite Well

"MRS NEWTON."

This seems to have made the nieces propose to pay a visit to their aunt, perhaps to try and relieve the monopoly of her existence and cheer her up a little. In their letter, doubtless, the dog motive is introduced that is so finely developed presently by Mrs. Newton. I should like to have been able to give the theme as enounced by the nieces themselves, but their letters are not before me. Mrs. Newton writes:—

"MY DEAR GIRLS,—Your Aunt receiv your Letter your Aunt will Be vary glad to
Art and Science

see you as it quite a greeable if it tis to you and Shee is Quite Willing to Eair the beds and the Rooms if you Like to Trust to hir and the Servantes; if not I may Go up there as you Wish. My Sister Sleeps in the Best Room as she allways Did and the Coock in the garret and you Can have the Rooms the same as you allways Did as your Aunt Donte set in the Parlour She Continlery Sets in the Ciching. your Aunt says she Cannot Part from the dog know hows and She Says he will not hurt you for he is Like a Child and I can safeley say My Self he wonte hurt you as She Cannot Sleep in the Room With out him as he allWay Sleep in the Same Room as She Dose. your Aunt is agreeable to Git in What Coles and Wood you Wish for I am know happy to say your Aunt is in as Good health as ever She Was and She is happy to hear you are Both Well your Aunt Wishes for Ancer By Return of Post.”

The nieces replied that their aunt must choose between the dog and them, and Mrs. Newton sends a second letter which
Essays on Life

brings her development to a climax. It runs:

"Dear Miss —, I have Receive your Letter and i Whent up to your Aunt as you Wish me and i Try to Perveal With her about the Dog But she Wold not Put the Dog away nor it alow him to Be Tied up But She Still Wishes you to Come as Shee says the Dog Shall not interrup you for She Donte alow the Dog nor it the Cats to Go in the Parlour never sence She has had it Donup ferfere of Spoiling the Paint your Aunt think it vary Strange you Should Be so vary Much afraid of a Dog and She says you Cant Go out in London But What you are up a gance one and She says She Wonte Trust the Dog in know one hands But her Owne for She is afraid theay Will not fill is Belley as he Lives upon Rost Beeff and Rost and Boil Moutten Wich he Eats More then the Servantes in the House there is not aney One Wold Beable to Give Sattefacktion upon that account Harry offerd to Take the Dog But She Wood not Trust him in our hands so I Cold not Do
aney thing With her your Aunt youse to Tell Me When we was at your House in London She Did not know how to make you amens and i Told her know it was the Time to Do it But i Considder She sets the Dog Before you your Aunt keep know Beer know Sprits know Wines in the House of aney Sort Oneley a Little Barl of Wine I made her in the Summer the Workmen and servantes are a Blige to Drink wauter Morning Noon and Night your Aunt the Same She Donte Low her Self aney Tee nor Coffee But is Looocking Wonderful Well

"I Still Remane your Humble Servant Mrs Newton

"I am vary sorry to think the Dog Per-ventes your Comeing

"I am Glad to hear you are Both Well and we are the same."

The nieces remained firm, and from the following letter it is plain the aunt gave way. The dog motive is repeated *pianissimo*, and is not returned to—not at least by Mrs. Newton.
"Dear Miss ——, I Receve your Letter on Thursday i Whent to your Aunt and i see her and She is a Greable to everyry thing i asked her and seme so vary Much Please to see you Both Next Tuseday and she has sent for the Faggots to Day and she Will Send for the Coles to Morrow and i will Go up there to Morrow Morning and Make the Fiers and Tend to the Beds and sleep in it Till you Come Down your Aunt sends her Love to you Both and she is Quite well your Aunt Wishes you wold Write againe Before you Come as she ma Expeckye and the Dog is not to Gointo the Parlor a Tall

"your Aunt kind Love to you Both & hopes you Wonte Fail in Coming according to Prommis

Mrs Newton."

From a later letter it appears that the nieces did not pay their visit after all, and what is worse a letter had miscarried, and the aunt sat up expecting them from seven till twelve at night, and Harry had paid for "Faggots and Coles quarter of Hund. Faggots Half tun of Coles l. 1s. 3d." Shortly afterwards,
however, "She" again talks of coming up to London herself and writes through her servant—

"My Dear girls i Receve your kind letter & I am happy to hear you ar both Well and I Was in hopes of seeing of you Both Down at My House this spring to stay a Wile I am Quite well my self in Helth But vary Low Spireted I am vary sorry to hear the Misforting of Poor charles & how he cum to flie in the Fier I cannot think. I should like to know if he is dead or a Live, and I shall come to London in August & stay three or four daies if it is agreable to you. Mrs. Newton has lost her mother in Law 4 day March & I hope you send me word Wather charles is Dead or a Live as soon as possible, and will you send me word what Little Betty is for I cannot make her out."

The next letter is a new handwriting, and tells the nieces of their aunt's death in the following terms:—

"Dear Miss ——, It is my most painful
duty to inform you that your dear aunt expired this morning comparatively easy as Hannah informs me and in so doing restored her soul to the custody of him whom she considered to be alone worthy of its care.

"The doctor had visited her about five minutes previously and had applied a blister.

"You and your sister will I am sure excuse further details at present and believe me with kindest remembrances to remain

"Yours truly, &c."

After a few days a lawyer's letter informs the nieces that their aunt had left them the bulk of her not very considerable property, but had charged them with an annuity of £1 a week to be paid to Harry and Mrs. Newton so long as the dog lived.

The only other letters by Mrs. Newton are written on paper of a different and more modern size; they leave an impression of having been written a good many years later. I take them as they come. The first is very short:—

"Dear Miss ——, I write to say I cannot
possibly come on Wednesday as we have killed a pig. your’s truely,

"ELIZABETH NEWTON."

The second runs:—

"DEAR MISS —, i hope you are both quite well in health & your Leg much better i am happy to say i am getting quite well again i hope Amandy has reached you safe by this time i sent a small parcel by Amandy, there was half a dozen Pats of butter & the Cakes was very homely and not so light as i could wish i hope by this time Sarah Ann has promised she will stay untill next monday as i think a few daies longer will not make much diferance and as her young man has been very considerate to wait so long as he has i think he would for a few days Longer dear Miss —— I wash for William and i have not got his clothes yet as it has been delayed by the carrier & i cannot possibly get it done before Sunday and i do not Like traviling on a Sunday but to oblige you i would come but to come sooner i cannot possibly but i hope Sarah Ann will be prevailed on once more as
She has so many times i feel sure if she tells her young man he will have patient for he is a very kind young man

"i remain your sincerely

"ELIZABETH NEWTON."

The last letter in my collection seems written almost within measurable distance of the Christmas-card era. The sheet is headed by a beautifully embossed device of some holly in red and green, wishing the recipient of the letter a merry Xmas and a happy new year, while the border is crimped and edged with blue. I know not what it is, but there is something in the writer's highly finished style that reminds me of Mendelssohn. It would almost do for the words of one of his celebrated "Lieder ohne Worte":

"DEAR MISS MARIA,—I hasten to acknowledge the receipt of your kind note with the inclosure for which I return my best thanks. I need scarcely say how glad I was to know that the volumes secured your approval, and that the announcement of the improvement in the condition of your Sister’s legs afforded
me infinite pleasure. The gratifying news encouraged me in the hope that now the nature of the disorder is comprehended her legs will—notwithstanding the process may be gradual—ultimately get quite well. The pretty Robin Redbreast which lay ensconced in your epistle, conveyed to me, in terms more eloquent than words, how much you desired me those Compliments which the little missive he bore in his bill expressed; the emblem is sweetly pretty, and now that we are again allowed to felicitate each other on another recurrence of the season of the Christian's rejoicing, permit me to tender to yourself, and by you to your Sister, mine and my Wife's heartfelt congratulations and warmest wishes with respect to the coming year. It is a common belief that if we take a retrospective view of each departing year, as it behoves us annually to do, we shall find the blessings which we have received to im-measurably outnumber our causes of sorrow. Speaking for myself I can fully subscribe to that sentiment, and doubtless neither Miss —— nor yourself are exceptions. Miss ——'s
illness and consequent confinement to the house has been a severe trial, but in that trouble an opportunity was afforded you to prove a Sister’s devotion and she has been enabled to realise a larger (if possible) display of sisterly affection.

“A happy Christmas to you both, and may the new year prove a Cornucopia from which still greater blessings than even those we have hitherto received, shall issue, to benefit us all by contributing to our temporal happiness and, what is of higher importance, conducing to our felicity hereafter.

“I was sorry to hear that you were so annoyed with mice and rats, and if I should have an opportunity to obtain a nice cat I will do so and send my boy to your house with it.

“I remain,

"Yours truly."

How little what is commonly called education can do after all towards the formation of a good style, and what a delightful volume might not be entitled “Half Hours with the Worst Authors.” Why, the finest word I
Art and Science

know of in the English language was coined, not by my poor old grandfather, whose education had left little to desire, nor by any of the admirable scholars whom he in his turn educated, but by an old matron who presided over one of the halls, or houses of his school. This good lady, whose name by the way was Bromfield, had a fine high temper of her own, or thought it politic to affect one. One night when the boys were particularly noisy she burst like a hurricane into the hall, collared a youngster, and told him he was "the ramp-ingest-scampingest-rackety-tackety-tow-row-roaringest boy in the whole school." Would Mrs. Newton have been able to set the aunt and the dog before us so vividly if she had been more highly educated? Would Mrs. Bromfield have been able to forge and hurl her thunderbolt of a word if she had been taught how to do so, or indeed been at much pains to create it at all? It came. It was her χάρισμα. She did not probably know that she had done what the greatest scholar would have had to rack his brains over for many an hour before he could even approach. Tradition
Essays on Life

says that having brought down her boy she looked round the hall in triumph, and then after a moment's lull said, "Young gentlemen, prayers are excused," and left them.

I have sometimes thought that, after all, the main use of a classical education consists in the check it gives to originality, and the way in which it prevents an inconvenient number of people from using their own eyes. That we will not be at the trouble of looking at things for ourselves if we can get any one to tell us what we ought to see goes without saying, and it is the business of schools and universities to assist us in this respect. The theory of evolution teaches that any power not worked at pretty high pressure will deteriorate: originality and freedom from affectation are all very well in their way, but we can easily have too much of them, and it is better that none should be either original or free from cant but those who insist on being so, no matter what hindrances obstruct, nor what incentives are offered them to see things through the regulation medium. To insist on seeing things for oneself is to be
an ἴδιώτης, or in plain English, an idiot; nor do I see any safer check against general vigour and clearness of thought, with consequent terseness of expression, than that provided by the curricula of our universities and schools of public instruction. If a young man, in spite of every effort to fit him with blinkers, will insist on getting rid of them, he must do so at his own risk. He will not be long in finding out his mistake. Our public schools and universities play the beneficent part in our social scheme that cattle do in forests: they browse the seedlings down and prevent the growth of all but the luckiest and sturdiest. Of course, if there are too many either cattle or schools, they browse so effectually that they find no more food, and starve till equilibrium is restored; but it seems to be a provision of nature that there should always be these alternate periods, during which either the cattle or the trees are getting the best of it; and, indeed, without such provision we should have neither the one nor the other. At this moment the cattle, doubtless, are in the ascendant, and if university extension
proceeds much farther, we shall assuredly have no more Mrs. Newtons and Mrs. Bromfields; but whatever is is best, and, on the whole, I should propose to let things find pretty much their own level.

However this may be, who can question that the treasures hidden in many a country house contain sleeping beauties even fairer than those that I have endeavoured to waken from long sleep in the foregoing article? How many Mrs. Quicklys are there not living in London at this present moment? For that Mrs. Quickly was an invention of Shakespeare's I will not believe. The old woman from whom he drew said every word that he put into Mrs. Quickly's mouth, and a great deal more which he did not and perhaps could not make use of. This question, however, would again lead me far from my subject, which I should mar were I to dwell upon it longer, and therefore leave with the hope that it may give my readers absolutely no food whatever for reflection.
I have been asked to speak on the question how to make the best of life, but may as well confess at once that I know nothing about it. I cannot think that I have made the best of my own life, nor is it likely that I shall make much better of what may or may not remain to me. I do not even know how to make the best of the twenty minutes that your committee has placed at my disposal, and as for life as a whole, who ever yet made the best of such a colossal opportunity by conscious effort and deliberation? In little things no doubt deliberate and conscious effort will help us, but we are speaking of large issues, and such kingdoms of heaven as the making the best of these come not by observation.

The question, therefore, on which I have undertaken to address you is, as you must all

---

1 An address delivered at the Somerville Club, February 27, 1895.
Essays on Life

know, fatuous, if it be faced seriously. Life is like playing a violin solo in public and learning the instrument as one goes on. One cannot make the best of such impossibilities, and the question is doubly fatuous until we are told which of our two lives—the conscious or the unconscious—is held by the asker to be the truer life. Which does the question contemplate—the life we know, or the life which others may know, but which we know not?

Death gives a life to some men and women compared with which their so-called existence here is as nothing. Which is the truer life of Shakespeare, Handel, that divine woman who wrote the "Odyssey," and of Jane Austen—the life which palpitated with sensible warm motion within their own bodies, or that in virtue of which they are still palpitating in ours? In whose consciousness does their truest life consist—their own, or ours? Can Shakespeare be said to have begun his true life till a hundred years or so after he was dead and buried? His physical life was but as an embryonic stage, a coming up out of darkness, a twilight and dawn before the sunrise of that
Art and Science

life of the world to come which he was to enjoy hereafter. We all live for a while after we are gone hence, but we are for the most part stillborn, or at any rate die in infancy, as regards that life which every age and country has recognised as higher and truer than the one of which we are now sentient. As the life of the race is larger, longer, and in all respects more to be considered than that of the individual, so is the life we live in others larger and more important than the one we live in ourselves. This appears nowhere perhaps more plainly than in the case of great teachers, who often in the lives of their pupils produce an effect that reaches far beyond anything produced while their single lives were yet unsupplemented by those other lives into which they infused their own.

Death to such people is the ending of a short life, but it does not touch the life they are already living in those whom they have taught; and happily, as none can know when he shall die, so none can make sure that he too shall not live long beyond the grave; for the life after death is like money before it—
no one can be sure that it may not fall to him or her even at the eleventh hour. Money and immortality come in such odd unaccountable ways that no one is cut off from hope. We may not have made either of them for ourselves, but yet another may give them to us in virtue of his or her love, which shall illumine us for ever, and establish us in some heavenly mansion whereof we neither dreamed nor shall ever dream. Look at the Doge Loredano Loredani, the old man's smile upon whose face has been reproduced so faithfully in so many lands that it can never henceforth be forgotten—would he have had one hundredth part of the life he now lives had he not been linked awhile with one of those heaven-sent men who know che cosa è amor? Look at Rembrandt's old woman in our National Gallery; had she died before she was eighty-three years old she would not have been living now. Then, when she was eighty-three, immortality perched upon her as a bird on a withered bough.

I seem to hear some one say that this is a mockery, a piece of special pleading, a giving
of stones to those that ask for bread. Life is not life unless we can feel it, and a life limited to a knowledge of such fraction of our work as may happen to survive us is no true life in other people; salve it as we may, death is not life any more than black is white.

The objection is not so true as it sounds. I do not deny that we had rather not die, nor do I pretend that much even in the case of the most favoured few can survive them beyond the grave. It is only because this is so that our own life is possible; others have made room for us, and we should make room for others in our turn without undue repining. What I maintain is that a not inconsiderable number of people do actually attain to a life beyond the grave which we can all feel forcibly enough, whether they can do so or not—that this life tends with increasing civilisation to become more and more potent, and that it is better worth considering, in spite of its being unfelt by ourselves, than any which we have felt or can ever feel in our own persons.

Take an extreme case. A group of people are photographed by Edison's new process—
Essays on Life

say Titiens, Trebelli, and Jenny Lind, with any two of the finest men singers the age has known—let them be photographed incessantly for half an hour while they perform a scene in "Lohengrin"; let all be done stereoscopically. Let them be phonographed at the same time so that their minutest shades of intonation are preserved, let the slides be coloured by a competent artist, and then let the scene be called suddenly into sight and sound, say a hundred years hence. Are those people dead or alive? Dead to themselves they are, but while they live so powerfully and so livingly in us, which is the greater paradox—to say that they are alive or that they are dead? To myself it seems that their life in others would be more truly life than their death to themselves is death. Granted that they do not present all the phenomena of life—who ever does so even when he is held to be alive? We are held to be alive because we present a sufficient number of living phenomena to let the others go without saying; those who see us take the part for the whole here as in everything else, and surely, in the case supposed.
above, the phenomena of life predominate so powerfully over those of death, that the people themselves must be held to be more alive than dead. Our living personality is, as the word implies, only our mask, and those who still own such a mask as I have supposed have a living personality. Granted again that the case just put is an extreme one; still many a man and many a woman has so stamped him or herself on his work that, though we would gladly have the aid of such accessories as we doubtless presently shall have to the livingness of our great dead, we can see them very sufficiently through the master pieces they have left us.

As for their own unconsciousness I do not deny it. The life of the embryo was unconscious before birth, and so is the life—I am speaking only of the life revealed to us by natural religion—after death. But as the embryonic and infant life of which we were unconscious was the most potent factor in our after life of consciousness, so the effect which we may unconsciously produce in others after death, and it may be even before it on those
who have never seen us, is in all sober seriousness our truer and more abiding life, and the one which those who would make the best of their sojourn here will take most into their consideration.

Unconsciousness is no bar to livingness. Our conscious actions are a drop in the sea as compared with our unconscious ones. Could we know all the life that is in us by way of circulation, nutrition, breathing, waste and repair, we should learn what an infinitesimally small part consciousness plays in our present existence; yet our unconscious life is as truly life as our conscious life, and though it is unconscious to itself it emerges into an indirect and vicarious consciousness in our other and conscious self, which exists but in virtue of our unconscious self. So we have also a vicarious consciousness in others. The unconscious life of those that have gone before us has in great part moulded us into such men and women as we are, and our own unconscious lives will in like manner have a vicarious consciousness in others, though we be dead enough to it in ourselves.
Art and Science

If it is again urged that it matters not to us how much we may be alive in others, if we are to know nothing about it, I reply that the common instinct of all who are worth considering gives the lie to such cynicism. I see here present some who have achieved, and others who no doubt will achieve, success in literature. Will one of them hesitate to admit that it is a lively pleasure to her to feel that on the other side of the world some one may be smiling happily over her work, and that she is thus living in that person though she knows nothing about it? Here it seems to me that true faith comes in. Faith does not consist, as the Sunday School pupil said, "in the power of believing that which we know to be untrue." It consists in holding fast that which the healthiest and most kindly instincts of the best and most sensible men and women are intuitively possessed of, without caring to require much evidence further than the fact that such people are so convinced; and for my own part I find the best men and women I know unanimous in feeling that life in others, even though we know
nothing about it, is nevertheless a thing to be desired and gratefully accepted if we can get it either before death or after. I observe also that a large number of men and women do actually attain to such life, and in some cases continue so to live, if not for ever, yet to what is practically much the same thing. Our life then in this world is, to natural religion as much as to revealed, a period of probation. The use we make of it is to settle how far we are to enter into another, and whether that other is to be a heaven of just affection or a hell of righteous condemnation.

Who, then, are the most likely so to run that they may obtain this veritable prize of our high calling? Setting aside such lucky numbers drawn as it were in the lottery of immortality, which I have referred to casually above, and setting aside also the chances and changes from which even immortality is not exempt, who on the whole are most likely to live anew in the affectionate thoughts of those who never so much as saw them in the flesh, and know not even their names? There is a nisus, a straining in the dull dumb economy
of things, in virtue of which some, whether they will it and know it or no, are more likely to live after death than others, and who are these? Those who aimed at it as by some great thing that they would do to make them famous? Those who have lived most in themselves and for themselves, or those who have been most ensouled consciously, but perhaps better unconsciously, directly but more often indirectly, by the most living souls past and present that have flitted near them? Can we think of a man or woman who grips us firmly, at the thought of whom we kindle when we are alone in our honest daw's plumes, with none to admire or shrug his shoulders, can we think of one such, the secret of whose power does not lie in the charm of his or her personality—that is to say, in the wideness of his or her sympathy with, and therefore life in and communion with other people? In the wreckage that comes ashore from the sea of time there is much tinsel stuff that we must preserve and study if we would know our own times and people; granted that many a dead charlatan lives long and enters largely and
necessarily into our own lives; we use them and throw them away when we have done with them. I do not speak of these, I do not speak of the Virgils and Alexander Popes, and who can say how many more whose names I dare not mention for fear of offending. They are as stuffed birds or beasts in a Museum; serviceable no doubt from a scientific standpoint, but with no vivid or vivifying hold upon us. They seem to be alive, but are not. I am speaking of those who do actually live in us, and move us to higher achievements though they be long dead, whose life thrusts out our own and overrides it. I speak of those who draw us ever more towards them from youth to age, and to think of whom is to feel at once that we are in the hands of those we love, and whom we would most wish to resemble. What is the secret of the hold that these people have upon us? Is it not that while, conventionally speaking, alive, they most merged their lives in, and were in fullest communion with those among whom they lived? They found their lives in losing them. We never love the memory of
any one unless we feel that he or she was himself or herself a lover.

I have seen it urged, again, in querulous accents, that the so-called immortality even of the most immortal is not for ever. I see a passage to this effect in a book that is making a stir as I write. I will quote it. The writer says:—

"So, it seems to me, is the immortality we so glibly predicate of departed artists. If they survive at all, it is but a shadowy life they live, moving on through the gradations of slow decay to distant but inevitable death. They can no longer, as heretofore, speak directly to the hearts of their fellow-men, evoking their tears or laughter, and all the pleasures, be they sad or merry, of which imagination holds the secret. Driven from the marketplace they become first the companions of the student, then the victims of the specialist. He who would still hold familiar intercourse with them must train himself to penetrate the veil which in ever-thickening folds conceals them from the ordinary gaze; he must catch the
tone of a vanished society, he must move in a circle of alien associations, he must think in a language not his own."¹

This is crying for the moon, or rather pretending to cry for it, for the writer is obviously insincere. I see the Saturday Review says the passage I have just quoted "reaches almost to poetry," and indeed I find many blank verses in it, some of them very aggressive. No prose is free from an occasional blank verse, and a good writer will not go hunting over his work to rout them out, but nine or ten in little more than as many lines is indeed reaching too near to poetry for good prose. This, however, is a trifle, and might pass if the tone of the writer was not so obviously that of cheap pessimism. I know not which is cheapest, pessimism or optimism. One forces lights, the other darks; both are equally untrue to good art, and equally sure of their effect with the groundlings. The one extenuates, the other sets down in malice. The first is the more

Art and Science

amiable lie, but both are lies, and are known to be so by those who utter them. Talk about catching the tone of a vanished society to understand Rembrandt or Giovanni Bellini! It is nonsense—the folds do not thicken in front of these men; we understand them as well as those among whom they went about in the flesh, and perhaps better. Homer and Shakespeare speak to us probably far more effectually than they did to the men of their own time, and most likely we have them at their best. I cannot think that Shakespeare talked better than we hear him now in "Hamlet" or "Henry the Fourth"; like enough he would have been found a very disappointing person in a drawing-room. People stamp themselves on their work; if they have not done so they are naught, if they have we have them; and for the most part they stamp themselves deeper on their work than on their talk. No doubt Shakespeare and Handel will be one day clean forgotten, as though they had never been born. The world will in the end die; mortality therefore itself is not immortal, and when death dies the life of these men will die
Essays on Life

with it—but not sooner. It is enough that they should live within us and move us for many ages as they have and will. Such immortality, therefore, as some men and women are born to, achieve, or have thrust upon them, is a practical if not a technical immortality, and he who would have more let him have nothing.

I see I have drifted into speaking rather of how to make the best of death than of life, but who can speak of life without his thoughts turning instantly to that which is beyond it? He or she who has made the best of the life after death has made the best of the life before it; who cares one straw for any such chances and changes as will commonly befall him here if he is upheld by the full and certain hope of everlasting life in the affections of those that shall come after? If the life after death is happy in the hearts of others, it matters little how unhappy was the life before it.

And now I leave my subject, not without misgiving that I shall have disappointed you. But for the great attention which is being
paid to the work from which I have quoted above, I should not have thought it well to insist on points with which you are, I doubt not, as fully impressed as I am: but that book weakens the sanctions of natural religion, and minimises the comfort which it affords us, while it does more to undermine than to support the foundations of what is commonly called belief. Therefore I was glad to embrace this opportunity of protesting. Otherwise I should not have been so serious on a matter that transcends all seriousness. Lord Beaconsfield cut it shorter with more effect. When asked to give a rule of life for the son of a friend he said, "Do not let him try and find out who wrote the letters of Junius." Pressed for further counsel he added, "Nor yet who was the man in the iron mask"—and he would say no more. Don't bore people. And yet I am by no means sure that a good many people do not think themselves ill-used unless he who addresses them has thoroughly well bored them—especially if they have paid any money for hearing him. My great namesake said, "Surely the pleasure is as great
of being cheated as to cheat," and great as the pleasure both of cheating and boring undoubtedly is, I believe he was right. So I remember a poem which came out some thirty years ago in *Punch*, about a young lady who went forth in quest to "Some burden make or burden bear, but which she did not greatly care, oh Miserie." So, again, all the holy men and women who in the Middle Ages professed to have discovered how to make the best of life took care that being bored, if not cheated, should have a large place in their programme. Still there are limits, and I close not without fear that I may have exceeded them.
THE SANCTUARY OF MONTRIGONE

The only place in the Valsesia, except Varallo, where I at present suspect the presence of Tabachetti is at Montrigone, a little-known sanctuary dedicated to St. Anne, about three-quarters of a mile south of Borgo-Sesia station. The situation is, of course, lovely, but the sanctuary does not offer any features of architectural interest. The sacristan told me it was founded in 1631; and in 1644 Giovanni d'Enrico, while engaged in superintending and completing the work undertaken here by himself and Giacomo Ferro, fell ill and died. I do not know whether or no there was an earlier sanctuary on the same site, but was told it was built on the demolition

1 Published in the Universal Review, November 1888.
2 Since this essay was written it has been ascertained by Cavaliere Francesco Negri, of Casale Monferrato, that Tabachetti died in 1615. If, therefore, the Sanctuary of Montrigone was not founded until 1631, it is plain that Tabachetti cannot have worked there. All the latest discoveries about Tabachetti's career will be found in Cavaliere Negri's pamphlet "Il Santuario di Crea" (Alessandria, 1902). See also note on p. 154.—R. A. S.
of a stronghold belonging to the Counts of Biandrate.

The incidents which it illustrates are treated with even more than the homeliness usual in works of this description when not dealing with such solemn events as the death and passion of Christ. Except when these subjects were being represented, something of the latitude, and even humour, allowed in the old mystery plays was permitted, doubtless from a desire to render the work more attractive to the peasants, who were the most numerous and most important pilgrims. It is not until faith begins to be weak that it fears an occasionally lighter treatment of semi-sacred subjects, and it is impossible to convey an accurate idea of the spirit prevailing at this hamlet of sanctuary without attuning oneself somewhat to the more pagan character of the place. Of irreverence, in the sense of a desire to laugh at things that are of high and serious import, there is not a trace, but at the same time there is a certain unbending of the bow at Montrigone which is not perceivable at Varallo.
Art and Science

The first chapel to the left on entering the church is that of the Birth of the Virgin. St. Anne is sitting up in bed. She is not at all ill—in fact, considering that the Virgin has only been born about five minutes, she is wonderful; still the doctors think it may be perhaps better that she should keep her room for half an hour longer, so the bed has been festooned with red and white paper roses, and the counterpane is covered with bouquets in baskets and in vases of glass and china. These cannot have been there during the actual birth of the Virgin, so I suppose they had been in readiness, and were brought in from an adjoining room as soon as the baby had been born. A lady on her left is bringing in some more flowers, which St. Anne is receiving with a smile and most gracious gesture of the hands. The first thing she asked for, when the birth was over, was for her three silver hearts. These were immediately brought to her, and she has got them all on, tied round her neck with a piece of blue silk ribbon.

Dear mamma has come. We felt sure she
would, and that any little misunderstandings between her and Joachim would ere long be forgotten and forgiven. They are both so good and sensible if they would only understand one another. At any rate, here she is, in high state at the right hand of the bed. She is dressed in black, for she has lost her husband some few years previously, but I do not believe a smarter, sprier old lady for her years could be found in Palestine, nor yet that either Giovanni d'Enrico or Giacomo Ferro could have conceived or executed such a character. The sacristan wanted to have it that she was not a woman at all, but was a portrait of St. Joachim, the Virgin's father. "Sembra una donna," he pleaded more than once, "ma non è donna." Surely, however, in works of art even more than in other things, there is no "is" but seeming, and if a figure seems female it must be taken as such. Besides, I asked one of the leading doctors at Varallo whether the figure was man or woman. He said it was evident I was not married, for that if I had been I should have seen at once that she was not only a woman but a mother-
Art and Science

in-law of the first magnitude, or, as he called it, "una suocera tremenda," and this without knowing that I wanted her to be a mother-in-law myself. Unfortunately she had no real drapery, so I could not settle the question as my friend Mr. H. F. Jones and I had been able to do at Varallo with the figure of Eve that had been turned into a Roman soldier assisting at the capture of Christ. I am not, however, disposed to waste more time upon anything so obvious, and will content myself with saying that we have here the Virgin's grandmother. I had never had the pleasure, so far as I remembered, of meeting this lady before, and was glad to have an opportunity of making her acquaintance.

Tradition says that it was she who chose the Virgin's name, and if so, what a debt of gratitude do we not owe her for her judicious selection! It makes one shudder to think what might have happened if she had named the child Keren-Happuch, as poor Job's daughter was called. How could we have said, "Ave Keren-Happuch!" What would the musicians have done? I forget whether
Maher-Shalal-Hash-Baz was a man or a woman, but there were plenty of names quite as unmanageable at the Virgin’s grandmother’s option, and we cannot sufficiently thank her for having chosen one that is so euphonious in every language which we need take into account. For this reason alone we should not grudge her her portrait, but we should try to draw the line here. I do not think we ought to give the Virgin’s great-grandmother a statue. Where is it to end? It is like Mr. Crookes’s ultimissimate atoms; we used to draw the line at ultimate atoms, and now it seems we are to go a step farther back and have ultimissimate atoms. How long, I wonder, will it be before we feel that it will be a material help to us to have ultimissimissimate atoms? Quavers stopped at demi-semi-demi, but there is no reason to suppose that either atoms or ancestresses of the Virgin will be so complacent.

I have said that on St. Anne’s left hand there is a lady who is bringing in some flowers. St. Anne was always passionately fond of flowers. There is a pretty story told about
Art and Science

her in one of the Fathers, I forget which, to the effect that when a child she was asked which she liked best—cakes or flowers? She could not yet speak plainly and lisped out, "Oh fowses, pretty fowses"; she added, however, with a sigh and as a kind of wistful corollary, "but cakes are very nice." She is not to have any cakes just now, but as soon as she has done thanking the lady for her beautiful nosegay, she is to have a couple of nice new-laid eggs, that are being brought her by another lady. Valsesian women immediately after their confinement always have eggs beaten up with wine and sugar, and one can tell a Valsesian Birth of the Virgin from a Venetian or a Florentine by the presence of the eggs. I learned this from an eminent Valsesian professor of medicine, who told me that, though not according to received rules, the eggs never seemed to do any harm. Here they are evidently to be beaten up, for there is neither spoon nor egg-cup, and we cannot suppose that they were hard-boiled. On the other hand, in the Middle Ages Italians never used egg-cups and spoons for boiled eggs.
The mediæval boiled egg was always eaten by dipping bread into the yolk.

Behind the lady who is bringing in the eggs is the under-under-nurse who is at the fire warming a towel. In the foreground we have the regulation midwife holding the regulation baby (who, by the way, was an astonishingly fine child for only five minutes old). Then comes the under-nurse—a good buxom creature, who, as usual, is feeling the water in the bath to see that it is of the right temperature. Next to her is the head-nurse, who is arranging the cradle. Behind the head-nurse is the under-under-nurse's drudge, who is just going out upon some errands. Lastly—for by this time we have got all round the chapel—we arrive at the Virgin's grandmother's body-guard, a stately, responsible-looking lady, standing in waiting upon her mistress. I put it to the reader—is it conceivable that St. Joachim should have been allowed in such a room at such a time, or that he should have had the courage to avail himself of the permission, even though it had been extended to him? At any rate, is it conceivable that he
should have been allowed to sit on St. Anne's right hand, laying down the law with a "Marry, come up here," and a "Marry, go down there," and a couple of such unabashed collars as the old lady has put on for the occasion?

Moreover (for I may as well demolish this mischievous confusion between St. Joachim and his mother-in-law once and for all), the merest tyro in hagiology knows that St. Joachim was not at home when the Virgin was born. He had been hustled out of the temple for having no children, and had fled desolate and dismayed into the wilderness. It shows how silly people are, for all the time he was going, if they had only waited a little, to be the father of the most remarkable person of purely human origin who had ever been born, and such a parent as this should surely not be hurried. The story is told in the frescoes of the chapel of Loreto, only a quarter of an hour's walk from Varallo, and no one can have known it better than D'Enrico. The frescoes are explained by written passages that tell us how, when
Joachim was in the desert, an angel came to him in the guise of a fair, civil young gentleman, and told him the Virgin was to be born. Then, later on, the same young gentleman appeared to him again, and bade him "in God's name be comforted, and turn again to his content," for the Virgin had been actually born. On which St. Joachim, who seems to have been of opinion that marriage after all was rather a failure, said that, as things were going on so nicely without him, he would stay in the desert just a little longer, and offered up a lamb as a pretext to gain time. Perhaps he guessed about his mother-in-law, or he may have asked the angel. Of course, even in spite of such evidence as this, I may be mistaken about the Virgin's grandmother's sex, and the sacristan may be right; but I can only say that if the lady sitting by St. Anne's bedside at Montrigone is the Virgin's father —well, in that case I must reconsider a good deal that I have been accustomed to believe was beyond question.

Taken singly, I suppose that none of the figures in the chapel, except the Virgin's grand-
Art and Science

mother, should be rated very highly. The under-nurse is the next best figure, and might very well be Tabachetti’s, for neither Giovanni d’Enrico nor Giacomo Ferro was successful with his female characters. There is not a single really comfortable woman in any chapel by either of them on the Sacro Monte at Varallo. Tabachetti, on the other hand, delighted in women; if they were young he made them comely and engaging, if they were old he gave them dignity and individual character, and the under-nurse is much more in accordance with Tabachetti’s habitual mental attitude than with D’Enrico’s or Giacomo Ferro’s. Still there are only four figures out of the eleven that are mere otiose supers, and taking the work as a whole it leaves a pleasant impression as being throughout naïve and homely, and sometimes, which is of less importance, technically excellent.

Allowance must, of course, be made for tawdry accessories and repeated coats of shiny oleaginous paint—very disagreeable where it has peeled off and almost more so where it has not. What work could stand against such
treatment as the Valsesian terra-cotta figures have had to put up with? Take the Venus of Milo; let her be done in terra-cotta, and have run, not much, but still something, in the baking; paint her pink, two oils, all over, and then varnish her—it will help to preserve the paint; glue a lot of horsehair on to her pate, half of which shall have come off, leaving the glue still showing; scrape her, not too thoroughly, get the village drawing-master to paint her again, and the drawing-master in the next provincial town to put a forest background behind her with the brightest emerald-green leaves that he can do for the money; let this painting and scraping and repainting be repeated several times over; festoon her with pink and white flowers made of tissue paper; surround her with the cheapest German imitations of the cheapest decorations that Birmingham can produce; let the night air and winter fogs get at her for three hundred years, and how easy, I wonder, will it be to see the goddess who will be still in great part there? True, in the case of the Birth of the Virgin chapel at Montrigone, there is no real
Art and Science

hair and no fresco background, but time has had abundant opportunities without these. I will conclude my notice of this chapel by saying that on the left, above the door through which the under-under-nurse’s drudge is about to pass, there is a good painted terra-cotta bust, said—but I believe on no authority—to be a portrait of Giovanni d’Enrico. Others say that the Virgin’s grandmother is Giovanni d’Enrico, but this is even more absurd than supposing her to be St. Joachim.

The next chapel to the Birth of the Virgin is that of the Sposalizio. There is no figure here which suggests Tabachetti, but still there are some very good ones. The best have no taint of barocco; the man who did them, whoever he may have been, had evidently a good deal of life and go, was taking reasonable pains, and did not know too much. Where this is the case no work can fail to please. Some of the figures have real hair and some terra cotta. There is no fresco background worth mentioning. A man sitting on the steps of the altar with a book on his lap, and holding up his hand to another, who is leaning over
him and talking to him, is among the best figures; some of the disappointed suitors who are breaking their wands are also very good.

The angel in the Annunciation chapel, which comes next in order, is a fine, burly, ship's-figurehead, commercial-hotel sort of being enough, but the Virgin is very ordinary. There is no real hair and no fresco background, only three dingy old blistered pictures of no interest whatever.

In the visit of Mary to Elizabeth there are three pleasing subordinate lady attendants, two to the left and one to the right of the principal figures; but these figures themselves are not satisfactory. There is no fresco background. Some of the figures have real hair and some terra cotta.

In the Circumcision and Purification chapel—for both these events seem contemplated in the one that follows—there are doves, but there is neither dog nor knife. Still Simeon, who has the infant Saviour in his arms, is looking at him in a way which can only mean that, knife or no knife, the matter is not going to end here. At Varallo they have now got a
dreadful knife for the Circumcision chapel. They had none last winter. What they have now got would do very well to kill a bullock with, but could not be used professionally with safety for any animal smaller than a rhinoceros. I imagine that some one was sent to Novara to buy a knife, and that, thinking it was for the Massacre of the Innocents chapel, he got the biggest he could see. Then when he brought it back people said "chow" several times, and put it upon the table and went away.

Returning to Montrigone, the Simeon is an excellent figure, and the Virgin is fairly good, but the prophetess Anna, who stands just behind her, is by far the most interesting in the group, and is alone enough to make me feel sure that Tabachetti gave more or less help here, as he had done years before at Orta. She, too, like the Virgin's grandmother, is a widow lady, and wears collars of a cut that seems to have prevailed ever since the Virgin was born some twenty years previously. There is a largeness and simplicity of treatment about the figure to which none but an artist of the
highest rank can reach, and D'Enrico was not more than a second or third-rate man. The hood is like Handel's Truth sailing upon the broad wings of Time, a prophetic strain that nothing but the old experience of a great poet can reach. The lips of the prophetess are for the moment closed, but she has been prophesying all the morning, and the people round the wall in the background are in ecstasies at the lucidity with which she has explained all sorts of difficulties that they had never been able to understand till now. They are putting their forefingers on their thumbs and their thumbs on their forefingers, and saying how clearly they see it all and what a wonderful woman Anna is. A prophet indeed is not generally without honour save in his own country, but then a country is generally not without honour save with its own prophet, and Anna has been glorifying her country rather than reviling it. Besides, the rule may not have applied to prophetesses.

The Death of the Virgin is the last of the six chapels inside the church itself. The Apostles, who of course are present, have all
of them real hair, but, if I may say so, they want a wash and a brush-up so very badly that I cannot feel any confidence in writing about them. I should say that, take them all round, they are a good average sample of apostle as apostles generally go. Two or three of them are nervously anxious to find appropriate quotations in books that lie open before them, which they are searching with eager haste; but I do not see one figure about which I should like to say positively that it is either good or bad. There is a good bust of a man, matching the one in the Birth of the Virgin chapel, which is said to be a portrait of Giovanni d'Enrico, but it is not known whom it represents.

Outside the church, in three contiguous cells that form part of the foundations, are:

1. A dead Christ, the head of which is very impressive, while the rest of the figure is poor. I examined the treatment of the hair, which is terra-cotta, and compared it with all other like hair in the chapels above described; I could find nothing like it, and think it most likely that Giacomo Ferro did the figure, and
Essays on Life

got Tabachetti to do the head, or that they brought the head from some unused figure by Tabachetti at Varallo, for I know no other artist of the time and neighbourhood who could have done it.

2. A Magdalene in the desert. The desert is a little coal-cellar of an arch, containing a skull and a profusion of pink and white paper bouquets, the two largest of which the Magdalene is hugging while she is saying her prayers. She is a very self-sufficient lady, who we may be sure will not stay in the desert a day longer than she can help, and while there will flirt even with the skull if she can find nothing better to flirt with. I cannot think that her repentance is as yet genuine, and as for her praying there is no object in her doing so, for she does not want anything.

3. In the next desert there is a very beautiful figure of St. John the Baptist kneeling and looking upwards. This figure puzzles me more than any other at Montrigone; it appears to be of the fifteenth rather than the sixteenth century; it hardly reminds me of
Art and Science

Gaudenzio, and still less of any other Valsesian artist. It is a work of unusual beauty, but I can form no idea as to its authorship.

I wrote the foregoing pages in the church at Montrigone itself, having brought my camp-stool with me. It was Sunday; the church was open all day, but there was no mass said, and hardly any one came. The sacristan was a kind, gentle, little old man, who let me do whatever I wanted. He sat on the doorstep of the main door, mending vestments, and to this end was cutting up a fine piece of figured silk from one to two hundred years old, which, if I could have got it, for half its value, I should much like to have bought. I sat in the cool of the church while he sat in the doorway, which was still in shadow, snipping and snipping, and then sewing, I am sure with admirable neatness. He made a charming picture, with the arched portico over his head, the green grass and low church wall behind him, and then a lovely landscape of wood and pasture and valleys and hillside. Every now and then he would come and chirrup about
Essays on Life

Joachim, for he was pained and shocked at my having said that his Joachim was some one else and not Joachim at all. I said I was very sorry, but I was afraid the figure was a woman. He asked me what he was to do. He had known it, man and boy, this sixty years, and had always shown it as St. Joachim; he had never heard any one but myself question his ascription, and could not suddenly change his mind about it at the bidding of a stranger. At the same time he felt it was a very serious thing to continue showing it as the Virgin's father if it was really her grandmother. I told him I thought this was a case for his spiritual director, and that if he felt uncomfortable about it he should consult his parish priest and do as he was told.

On leaving Montrigone, with a pleasant sense of having made acquaintance with a new and, in many respects, interesting work, I could not get the sacristan and our difference of opinion out of my head. What, I asked myself, are the differences that unhappily divide Christendom, and what are those that divide Christendom from modern
Art and Science

schools of thought, but a seeing of Joachims as the Virgin’s grandmothers on a larger scale? True, we cannot call figures Joachim when we know perfectly well that they are nothing of the kind; but I registered a vow that henceforward when I called Joachims the Virgin’s grandmothers I would bear more in mind than I have perhaps always hitherto done, how hard it is for those who have been taught to see them as Joachims to think of them as something different. I trust that I have not been unfaithful to this vow in the preceding article. If the reader differs from me, let me ask him to remember how hard it is for one who has got a figure well into his head as the Virgin’s grandmother to see it as Joachim.
A MEDIEVAL GIRL SCHOOL

This last summer I revisited Oropa, near Biella, to see what connection I could find between the Oropa chapels and those at Varallo. I will take this opportunity of describing the chapels at Oropa, and more especially the remarkable fossil, or petrified girl school, commonly known as the Dimora, or Sojourn of the Virgin Mary in the Temple.

If I do not take these works so seriously as the reader may expect, let me beg him, before he blames me, to go to Oropa and see the originals for himself. Have the good people of Oropa themselves taken them very seriously? Are we in an atmosphere where we need be at much pains to speak with bated breath? We, as is well known, love to take even our pleasures sadly; the Italians take even their sadness allegramente, and combine devotion with amusement in a manner that we shall

1 Published in the Universal Review, December 1889.
do well to study if not imitate. For this best agrees with what we gather to have been the custom of Christ himself, who, indeed, never speaks of austerity but to condemn it. If Christianity is to be a living faith, it must penetrate a man's whole life, so that he can no more rid himself of it than he can of his flesh and bones or of his breathing. The Christianity that can be taken up and laid down as if it were a watch or a book is Christianity in name only. The true Christian can no more part from Christ in mirth than in sorrow. And, after all, what is the essence of Christianity? What is the kernel of the nut? Surely common sense and cheerfulness, with unflinching opposition to the charlatanisms and Pharisaisms of a man's own times. The essence of Christianity lies neither in dogma, nor yet in abnormally holy life, but in faith in an unseen world, in doing one's duty, in speaking the truth, in finding the true life rather in others than in oneself, and in the certain hope that he who loses his life on these behalves finds more than he has lost. What can Agnosticism do against such Chris-
tianity as this? I should be shocked if anything I had ever written or shall ever write should seem to make light of these things. I should be shocked also if I did not know how to be amused with things that amiable people obviously intended to be amusing.

The reader may need to be reminded that Oropa is among the somewhat infrequent sanctuaries at which the Madonna and infant Christ are not white, but black. I shall return to this peculiarity of Oropa later on, but will leave it for the present. For the general characteristics of the place I must refer the reader to my book, "Alps and Sanctuaries."¹ I propose to confine myself here to the ten or a dozen chapels containing life-sized terra-cotta figures, painted up to nature, that form one of the main features of the place. At a first glance, perhaps, all these chapels will seem uninteresting; I venture to think, however, that some, if not most of them, though falling a good deal short of the best work at Varallo and Crea, are still in their own way of considerable importance.

¹ Longmans & Co., 1890.
Art and Science

The first chapel with which we need concern ourselves is numbered 4, and shows the Conception of the Virgin Mary. It represents St. Anne as kneeling before a terrific dragon or, as the Italians call it, "insect," about the size of a Crystal Palace pleiosaur. This "insect" is supposed to have just had its head badly crushed by St. Anne, who seems to be begging its pardon. The text "Ipsa conteret caput tuum" is written outside the chapel. The figures have no artistic interest. As regards dragons being called insects, the reader may perhaps remember that the island of S. Giulio, in the Lago d'Orta, was infested with insetti, which S. Giulio destroyed, and which appear, in a fresco underneath the church on the island, to have been monstrous and ferocious dragons; but I cannot remember whether their bodies are divided into three sections, and whether or no they have exactly six legs—without which, I am told, they cannot be true insects.

The fifth chapel represents the birth of the Virgin. Having obtained permission to go inside it, I found the date 1715 cut large and
Essays on Life

deep on the back of one figure before baking, and I imagine that this date covers the whole. There is a Queen Anne feeling throughout the composition, and if we were told that the sculptor and Francis Bird, sculptor of the statue in front of St. Paul’s Cathedral, had studied under the same master, we could very well believe it. The apartment in which the Virgin was born is spacious, and in striking contrast to the one in which she herself gave birth to the Redeemer. St. Anne occupies the centre of the composition, in an enormous bed; on her right there is a lady of the George Cruikshank style of beauty, and on the left an older person. Both are gesturing and impressing upon St. Anne the enormous obligation she has just conferred upon mankind; they seem also to be imploring her not to overtax her strength, but, strange to say, they are giving her neither flowers nor anything to eat and drink. I know no other birth of the Virgin in which St. Anne wants so little keeping up.

I have explained in my book "Ex Voto,"

1 Longmans & Co., 1890.
but should perhaps repeat here, that the distinguishing characteristic of the Birth of the Virgin, as rendered by Valsesian artists, is that St. Anne always has eggs immediately after the infant is born, and usually a good deal more, whereas the Madonna never has anything to eat or drink. The eggs are in accordance with a custom that still prevails among the peasant classes in the Valsesia, where women on giving birth to a child generally are given a *sabaglione*—an egg beaten up with a little wine, or rum, and sugar. East of Milan the Virgin's mother does not have eggs, and I suppose, from the absence of the eggs at Oropa, that the custom above referred to does not prevail in the Biellese district. The Virgin also is invariably washed. St. John the Baptist, when he is born at all, which is not very often, is also washed; but I have not observed that St. Elizabeth has anything like the attention paid her that is given to St. Anne. What, however, is wanting here at Oropa in meat and drink is made up in Cupids; they swarm like flies on the walls, clouds, cornices, and capitals of columns.
Against the right-hand wall are two lady-helps, each warming a towel at a glowing fire, to be ready against the baby should come out of its bath; while in the right-hand foreground we have the *levatrice*, who having discharged her task, and being now so disposed, has removed the bottle from the chimney-piece, and put it near some bread, fruit and a chicken, over which she is about to discuss the confinement with two other gossips. The *levatrice* is a very characteristic figure, but the best in the chapel is the one of the head nurse, near the middle of the composition; she has now the infant in full charge, and is showing it to St. Joachim, with an expression as though she were telling him that her husband was a merry man. I am afraid Shakespeare was dead before the sculptor was born, otherwise I should have felt certain that he had drawn Juliet's nurse from this figure. As for the little Virgin herself, I believe her to be a fine boy of about ten months old. Viewing the work as a whole, if I only felt more sure what artistic merit really is, I should say that, though the chapel cannot be rated very
highly from some standpoints, there are others from which it may be praised warmly enough. It is innocent of anatomy-worship, free from affectation or swagger, and not devoid of a good deal of homely naïveté. It can no more be compared with Tabachetti or Donatello than Hogarth can with Rembrandt or Giovanni Bellini; but as it does not transcend the limitations of its age, so neither is it wanting in whatever merits that age possessed; and there is no age without merits of some kind. There is no inscription saying who made the figures, but tradition gives them to Pietro Aureggio Termine, of Biella, commonly called Aureggio. This is confirmed by their strong resemblance to those in the Dimora Chapel, in which there is an inscription that names Aureggio as the sculptor.

The sixth chapel deals with the Presentation of the Virgin in the Temple. The Virgin is very small, but it must be remembered that she is only seven years old, and she is not nearly so small as she is at Crea, where, though a life-sized figure is intended, the head is hardly
bigger than an apple. She is rushing up the steps with open arms towards the High Priest, who is standing at the top. For her it is nothing alarming; it is the High Priest who appears frightened; but it will all come right in time. The Virgin seems to be saying, "Why, don't you know me? I'm the Virgin Mary." But the High Priest does not feel so sure about that, and will make further inquiries. The scene, which comprises some twenty figures, is animated enough, and though it hardly kindles enthusiasm, still does not fail to please. It looks as though of somewhat older date than the Birth of the Virgin chapel, and I should say shows more signs of direct Valsesian influence. In Marocco's book about Oropa it is ascribed to Aureggio, but I find it difficult to accept this.

The seventh, and in many respects most interesting chapel at Oropa, shows what is in reality a medieval Italian girl school, as nearly like the thing itself as the artist could make it; we are expected, however, to see in this the high-class kind of Girton College for young
gentlewomen that was attached to the Temple at Jerusalem, under the direction of the Chief Priest's wife, or some one of his near female relatives. Here all well-to-do Jewish young women completed their education, and here accordingly we find the Virgin, whose parents desired she should shine in every accomplishment, and enjoy all the advantages their ample means commanded.

I have met with no traces of the Virgin during the years between her Presentation in the Temple and her becoming head girl at Temple College. These years, we may be assured, can hardly have been other than eventful; but incidents, or bits of life, are like living forms—it is only here and here, as by rare chance, that one of them gets arrested and fossilised; the greater number disappear like the greater number of antediluvian molluscs, and no one can say why one of these flies, as it were, of life should get preserved in amber more than another. Talk, indeed, about luck and cunning; what a grain of sand as against a hundredweight is cunning's share here as against luck's. What moment could
be more humdrum and unworthy of special record than the one chosen by the artist for the chapel we are considering? Why should this one get arrested in its flight and made immortal when so many worthier ones have perished? Yet preserved it assuredly is; it is as though some fairy’s wand had struck the medieval Miss Pinkerton, Amelia Sedley, and others who do duty instead of the Hebrew originals. It has locked them up as sleeping beauties, whose charms all may look upon. Surely the hours are like the women grinding at the mill—the one is taken and the other left, and none can give the reason more than he can say why Gallio should have won immortality by caring for none of “these things.”

It seems to me, moreover, that fairies have changed their practice now in the matter of sleeping beauties, much as shopkeepers have done in Regent Street. Formerly the shopkeeper used to shut up his goods behind strong shutters, so that no one might see them after closing hours. Now he leaves everything open to the eye and turns the gas on. So
the fairies, who used to lock up their sleeping beauties in impenetrable thickets, now leave them in the most public places they can find, as knowing that they will there most certainly escape notice. Look at De Hooghe; look at "The Pilgrim’s Progress," or even Shakespeare himself—how long they slept unawakened, though they were in broad daylight and on the public thoroughfares all the time. Look at Tabachetti, and the masterpieces he left at Varallo. His figures there are exposed to the gaze of every passer-by; yet who heeds them? Who, save a very few, even know of their existence? Look again at Gaudenzio Ferrari, or the "Danse des Paysans," by Holbein, to which I ventured to call attention in the Universal Review. No, no; if a thing be in Central Africa, it is the glory of this age to find it out; so the fairies think it safer to conceal their protégés under a show of openness; for the schoolmaster is much abroad, and there is no hedge so thick or so thorny as the dulness of culture.

It may be, again, that ever so many years hence, when Mr. Darwin’s earth-worms shall
Essays on Life

have buried Oropa hundreds of feet deep, some one sinking a well or making a railway-cutting will unearth these chapels, and will believe them to have been houses, and to contain the exuviae of the living forms that tenanted them. In the meantime, however, let us return to a consideration of the chapel as it may now be seen by any one who cares to pass that way.

The work consists of about forty figures in all, not counting Cupids, and is divided into four main divisions. First, there is the large public sitting-room or drawing-room of the College, where the elder young ladies are engaged in various elegant employments. Three, at a table to the left, are making a mitre for the Bishop, as may be seen from the model on the table. Some are merely spinning or about to spin. One young lady, sitting rather apart from the others, is doing an elaborate piece of needlework at a tambour-frame near the window; others are making lace or slippers, probably for the new curate; another is struggling with a letter, or perhaps a theme, which seems to be giving her a good
deal of trouble, but which, when done, will, I am sure, be beautiful. One dear little girl is simply reading "Paul and Virginia" underneath the window, and is so concealed that I hardly think she can be seen from the outside at all, though from inside she is delightful; it was with great regret that I could not get her into any photograph. One most amiable young woman has got a child's head on her lap, the child having played itself to sleep. All are industriously and agreeably employed in some way or other; all are plump; all are nice looking; there is not one Becky Sharp in the whole school; on the contrary, as in "Pious Orgies," all is pious—or sub-pious—and all, if not great, is at least eminently respectable. One feels that St. Joachim and St. Anne could not have chosen a school more judiciously, and that if one had a daughter oneself this is exactly where one would wish to place her. If there is a fault of any kind in the arrangements, it is that they do not keep cats enough. The place is overrun with mice, though what these can find to eat I know not. It occurs to me also that the young ladies
Essays on Life

might be kept a little more free of spiders' webs; but in all these chapels, bats, mice and spiders are troublesome.

Off the main drawing-room on the side facing the window there is a dais, which is approached by a large raised semicircular step, higher than the rest of the floor, but lower than the dais itself. The dais is, of course, reserved for the venerable Lady Principal and the under-mistresses, one of whom, by the way, is a little more mondaine than might have been expected, and is admiring herself in a looking-glass—unless, indeed, she is only looking to see if there is a spot of ink on her face. The Lady Principal is seated near a table, on which lie some books in expensive bindings, which I imagine to have been presented to her by the parents of pupils who were leaving school. One has given her a photographic album; another a large scrapbook, for illustrations of all kinds; a third volume has red edges, and is presumably of a devotional character. If I dared venture another criticism, I should say it would be better not to keep the ink-pot on the top of
these books. The Lady Principal is being read to by the monitress for the week, whose duty it was to recite selected passages from the most approved Hebrew writers; she appears to be a good deal outraged, possibly at the faulty intonation of the reader, which she has long tried vainly to correct; or perhaps she has been hearing of the atrocious way in which her forefathers had treated the prophets, and is explaining to the young ladies how impossible it would be, in their own more enlightened age, for a prophet to fail of recognition.

On the half-daïs, as I suppose the large semicircular step between the main room and the daïs should be called, we find, first, the monitress for the week, who stands up while she recites; and secondly, the Virgin herself, who is the only pupil allowed a seat so near to the august presence of the Lady Principal. She is ostensibly doing a piece of embroidery which is stretched on a cushion on her lap, but I should say that she was chiefly interested in the nearest of four pretty little Cupids, who are all trying to attract her attention, though they pay no court to any other young lady.
I have sometimes wondered whether the obviously scandalised gesture of the Lady Principal might not be directed at these Cupids, rather than at anything the monitress may have been reading, for she would surely find them disquieting. Or she may be saying, "Why, bless me! I do declare the Virgin has got another hamper, and St. Anne's cakes are always so terribly rich!" Certainly the hamper is there, close to the Virgin, and the Lady Principal's action may be well directed at it, but it may have been sent to some other young lady, and be put on the sub-dais for public exhibition. It looks as if it might have come from Fortnum and Mason's, and I half expected to find a label, addressing it to "The Virgin Mary, Temple College, Jerusalem," but if ever there was one the mice have long since eaten it. The Virgin herself does not seem to care much about it, but if she has a fault it is that she is generally a little apathetic.

Whose the hamper was, however, is a point we shall never now certainly determine, for the best fossil is worse than the worst living form.
Why, alas! was not Mr. Edison alive when this chapel was made? We might then have had a daily phonographic recital of the conversation, and an announcement might be put outside the chapels, telling us at what hours the figures would speak.

On either of side the main room there are two annexes opening out from it; these are reserved chiefly for the younger children, some of whom, I think, are little boys. In the left-hand annex, behind the ladies who are making a mitre, there is a child who has got a cake, and another has some fruit—possibly given them by the Virgin—and a third child is begging for some of it. The light failed so completely here that I was not able to photograph any of these figures. It was a dull September afternoon, and the clouds had settled thick round the chapel, which is never very light, and is nearly 4000 feet above the sea. I waited till such twilight as made it hopeless that more detail could be got—and a queer ghostly place enough it was to wait in—but after giving the plate an exposure of fifty minutes, I saw I could get no more, and desisted.
These long photographic exposures have the advantage that one is compelled to study a work in detail through mere lack of other employment, and that one can take one's notes in peace without being tempted to hurry over them; but even so I continually find I have omitted to note, and have clean forgotten, much that I want later on.

In the other annex there are also one or two younger children, but it seems to have been set apart for conversation and relaxation more than any other part of the establishment.

I have already said that the work is signed by an inscription inside the chapel, to the effect that the sculptures are by Pietro Aureggio Termine di Biella. It will be seen that the young ladies are exceedingly like one another, and that the artist aimed at nothing more than a faithful rendering of the life of his own times. Let us be thankful that he aimed at nothing less. Perhaps his wife kept a girls' school; or he may have had a large family of fat, good-natured daughters, whose little ways he had studied attentively; at all events the
work is full of spontaneous incident, and cannot fail to become more and more interesting as the age it renders falls farther back into the past. It is to be regretted that many artists, better known men, have not been satisfied with the humbler ambitions of this most amiable and interesting sculptor. If he has left us no laboured life-studies, he has at least done something for us which we can find nowhere else, which we should be very sorry not to have, and the fidelity of which to Italian life at the beginning of the last century will not be disputed.

The eighth chapel is that of the Sposalizio, is certainly not by Aureggio, and I should say was mainly by the same sculptor who did the Presentation in the Temple. On going inside I found the figures had come from more than one source; some of them are constructed so absolutely on Valsesian principles, as regards technique, that it may be assumed they came from Varallo. Each of these last figures is in three pieces, that are baked separately and cemented together afterwards, hence they are more easily transported; no more clay is used
than is absolutely necessary; and the off-side of the figure is neglected; they will be found chiefly, if not entirely, at the top of the steps. The other figures are more solidly built, and do not remind me in their business features of anything in the Valsesia. There was a sculptor, Francesco Sala, of Locarno (doubtless the village a short distance below Varallo, and not the Locarno on the Lago Maggiore), who made designs for some of the Oropa chapels, and some of whose letters are still preserved, but whether the Valsesian figures in this present work are by him or not I cannot say.

The statues are twenty-five in number; I could find no date or signature; the work reminds me of Montrigone; several of the figures are not at all bad, and several have horsehair for hair, as at Varallo. The effect of the whole composition is better than we have a right to expect from any sculpture dating from the beginning of the last century.

The ninth chapel, the Annunciation, presents no feature of interest; nor yet does the tenth, the Visit of Mary to Elizabeth. The
eleventh, the Nativity, though rather better, is still not remarkable.

The twelfth, the Purification, is absurdly bad, but I do not know whether the expression of strong personal dislike to the Virgin which the High Priest wears is intended as prophetic, or whether it is the result of incompetence, or whether it is merely a smile gone wrong in the baking. It is amusing to find Marocco, who has not been strict about archaeological accuracy hitherto, complain here that there is an anachronism, inasmuch as some young ecclesiastics are dressed as they would be at present, and one of them actually carries a wax candle. This is not as it should be; in works like those at Oropa, where implicit reliance is justly placed on the earnest endeavours that have been so successfully made to thoroughly and carefully and patiently ensure the accuracy of the minutest details, it is a pity that even a single error should have escaped detection; this, however, has most unfortunately happened here, and Marocco feels it his duty to put us on our guard. He explains that the mistake arose from the
sculptor's having taken both his general ar-
angement and his details from some picture
of the fourteenth or fifteenth century, when
the value of the strictest historical accuracy
was not yet so fully understood.

It seems to me that in the matter of accu-
racy, priests and men of science whether lay
or regular on the one hand, and plain people
whether lay or regular on the other, are trying
to play a different game, and fail to under-
stand one another because they do not see
that their objects are not the same. The
cleric and the man of science (who is only the
cleric in his latest development) are trying to
develop a throat with two distinct passages—
one that shall refuse to pass even the smallest
gnat, and another that shall gracefully gulp
even the largest camel; whereas we men of
the street desire but one throat, and are con-
tent that this shall swallow nothing bigger
than a pony. Every one knows that there
is no such effectual means of developing the
power to swallow camels as incessant watch-
fulness for opportunities of straining at gnats,
and this should explain many passages that
Art and Science

puzzle us in the work both of our clerics and our scientists. I, not being a man of science, still continue to do what I said I did in "Alps and Sanctuaries," and make it a rule to earnestly and patiently and carefully swallow a few of the smallest gnats I can find several times a day, as the best astringent for the throat I know of.

The thirteenth chapel is the Marriage Feast at Cana of Galilee. This is the best chapel as a work of art; indeed, it is the only one which can claim to be taken quite seriously. Not that all the figures are very good; those to the left of the composition are commonplace enough; nor are the Christ and the giver of the feast at all remarkable; but the ten or dozen figures of guests and attendants at the right-hand end of the work are as good as anything of their kind can be, and remind me so strongly of Tabachetti that I cannot doubt they were done by some one who was indirectly influenced by that great sculptor's work. It is not likely that Tabachetti was alive long after 1640, by which time he would have been about eighty years old; and the founda-
tions of this chapel were not laid till about 1690; the statues are probably a few years later; they can hardly, therefore, be by one who had even studied under Tabachetti; but until I found out the dates, and went inside the chapel to see the way in which the figures had been constructed, I was inclined to think they might be by Tabachetti himself, of whom, indeed, they are not unworthy. On examining the figures I found them more heavily constructed than Tabachetti's are, with smaller holes for taking out superfluous clay, and more finished on the off-sides. Marocco says the sculptor is not known. I looked in vain for any date or signature. Possibly the right-hand figures (for the left-hand ones can hardly be by the same hand) may be by some sculptor from Crea, which is at no very great distance from Oropa, who was penetrated by Tabachetti's influence; but whether as regards action and concert with one another, or as regards excellence in detail, I do not see how anything can be more realistic, and yet more harmoniously composed. The placing of the musicians in a minstrels' gallery helps the
Art and Science

effect; these musicians are six in number, and the other figures are twenty-three. Under the table, between Christ and the giver of the feast, there is a cat.

The fourteenth chapel, the Assumption of the Virgin Mary, is without interest.

The fifteenth, the Coronation of the Virgin, contains forty-six angels, twenty-six cherubs, fifty-six saints, the Holy Trinity, the Madonna herself, and twenty-four innocents, making 156 statues in all. Of these I am afraid there is not one of more than ordinary merit; the most interesting is a half-length nude life-study of Disma—the good thief. After what had been promised him it was impossible to exclude him, but it was felt that a half-length nude figure would be as much as he could reasonably expect.

Behind the sanctuary there is a semi-ruinous and wholly valueless work, which shows the finding of the black image, which is now in the church, but is only shown on great festivals.

This leads us to a consideration that I have delayed till now. The black image is
Essays on Life

the central feature of Oropa; it is the *raison d'être* of the whole place, and all else is a mere incrustation, so to speak, around it. According to this image, then, which was carved by St. Luke himself, and than which nothing can be better authenticated, both the Madonna and the infant Christ were as black as anything can be conceived. It is not likely that they were as black as they have been painted; no one yet ever was so black as that; yet, even allowing for some exaggeration on St. Luke's part, they must have been exceedingly black if the portrait is to be accepted; and uncompromisingly black they accordingly are on most of the wayside chapels for many a mile around Oropa. Yet in the chapels we have been hitherto considering—works in which, as we know, the most punctilious regard has been shown to accuracy—both the Virgin and Christ are uncompromisingly white. As in the shops under the Colonnade where devotional knick-knacks are sold, you can buy a black china image or a white one, whichever you like; so with the pictures—the black and white are placed side by side—
pagando il danaro si può scegliere. It rests not with history or with the Church to say whether the Madonna and Child were black or white, but you may settle it for yourself, whichever way you please, or rather you are required, with the acquiescence of the Church, to hold that they were both black and white at one and the same time.

It cannot be maintained that the Church leaves the matter undecided, and by tolerating both types proclaims the question an open one, for she acquiesces in the portrait by St. Luke as genuine. How, then, justify the whiteness of the Holy Family in the chapels? If the portrait is not known as genuine, why set such a stumbling-block in our paths as to show us a black Madonna and a white one, both as historically accurate, within a few yards of one another?

I ask this not in mockery, but as knowing that the Church must have an explanation to give, if she would only give it, and as myself unable to find any, even the most far-fetched, that can bring what we see at Oropa, Loreto and elsewhere into harmony.
Essays on Life

with modern conscience, either intellectual or ethical.

I see, indeed, from an interesting article in the *Atlantic Monthly* for September 1889, entitled "The Black Madonna of Loreto," that black Madonnas were so frequent in ancient Christian art that "some of the early writers of the Church felt obliged to account for it by explaining that the Virgin was of a very dark complexion, as might be proved by the verse of Canticles which says, 'I am black, but comely, O ye daughters of Jerusalem.' Others maintained that she became black during her sojourn in Egypt. . . . Priests, of to-day, say that extreme age and exposure to the smoke of countless altar-candles have caused that change in complexion which the more naïve fathers of the Church attributed to the power of an Egyptian sun"; but the writer ruthlessly disposes of this supposition by pointing out that in nearly all the instances of black Madonnas it is the flesh alone that is entirely black, the crimson of the lips, the white of the eyes, and the draperies having preserved their original colour. The authoress of the
Art and Science

article (Mrs. Hilliard) goes on to tell us that Pausanias mentions two statues of the black Venus, and says that the oldest statue of Ceres among the Phigalenses was black. She adds that Minerva Aglaurus, the daughter of Cecrops, at Athens, was black; that Corinth had a black Venus, as also the Thespians; that the oracles of Dodona and Delphi were founded by black doves, the emissaries of Venus, and that the Isis Multimammia in the Capitol at Rome is black.

Sometimes I have asked myself whether the Church does not intend to suggest that the whole story falls outside the domain of history, and is to be held as the one great epos, or myth, common to all mankind; adaptable by each nation according to its own several needs; translatable, so to speak, into the facts of each individual nation, as the written word is translatable into its language, but appertaining to the realm of the imagination rather than to that of the understanding, and precious for spiritual rather than literal truths. More briefly, I have wondered whether she may not intend that such details
as whether the Virgin was white or black are of very little importance in comparison with the basing of ethics on a story that shall appeal to black races as well as to white ones.

If so, it is time we were made to understand this more clearly. If the Church, whether of Rome or England, would lean to some such view as this—tainted though it be with mysticism—if we could see either great branch of the Church make a frank, authoritative attempt to bring its teaching into greater harmony with the educated understanding and conscience of the time, instead of trying to fetter that understanding with bonds that gall it daily more and more profoundly; then I, for one, in view of the difficulty and graciousness of the task, and in view of the great importance of historical continuity, would gladly sink much of my own private opinion as to the value of the Christian ideal, and would gratefully help either Church or both, according to the best of my very feeble ability. On these terms, indeed, I could swallow not a few camels myself cheerfully enough.
Can we, however, see any signs as though either Rome or England will stir hand or foot to meet us? Can any step be pointed to as though either Church wished to make things easier for men holding the opinions held by the late Mr. Darwin, or by Mr. Herbert Spencer and Professor Huxley? How can those who accept evolution with any thoroughness accept such doctrines as the Incarnation or the Redemption with any but a quasi-allegorical and poetical interpretation? Can we conceivably accept these doctrines in the literal sense in which the Church advances them? And can the leaders of the Church be blind to the resistlessness of the current that has set against those literal interpretations which she seems to hug more and more closely the more religious life is awakened at all? The clergyman is wanted as supplementing the doctor and the lawyer in all civilised communities; these three keep watch on one another, and prevent one another from becoming too powerful. I, who distrust the doctrinaire in science even more than the doctrinaire in religion, should view with dis-
Essays on Life

may the abolition of the Church of England, as knowing that a blatant bastard science would instantly step into her shoes; but if some such deplorable consummation is to be avoided in England, it can only be through more evident leaning on the part of our clergy to such an interpretation of the Sacred History as the presence of a black and white Madonna almost side by side at Oropa appears to suggest.

I fear that in these last paragraphs I may have trenches on dangerous ground, but it is not possible to go to such places as Oropa without asking oneself what they mean and involve. As for the average Italian pilgrims, they do not appear to give the matter so much as a thought. They love Oropa, and flock to it in thousands during the summer; the President of the Administration assured me that they lodged, after a fashion, as many as ten thousand pilgrims on the 15th of last August. It is astonishing how living the statues are to these people, and how the wicked are upbraided and the good applauded. At Varallo, since I took the photographs I
published in my book "Ex Voto," an angry pilgrim has smashed the nose of the dwarf in Tabachetti's Journey to Calvary, for no other reason than inability to restrain his indignation against one who was helping to inflict pain on Christ. It is the real hair and the painting up to nature that does this. Here at Oropa I found a paper on the floor of the Sposalizio Chapel, which ran as follows:

"By the grace of God and the will of the administrative chapter of this sanctuary, there have come here to work — — —, mason, — — —, carpenter, and — — —, plumber, all of Chiavazza, on the twenty-first day of January 1886, full of cold (pieni di freddo).

"They write these two lines to record their visit. They pray the Blessed Virgin that she will maintain them safe and sound from everything equivocal that may befall them (sempre sani e salvi da ogni equivoco li possa accadere). Oh, farewell! We reverently salute all the present statues, and especially the Blessed Virgin, and the reader."

Through the Universal Review, I suppose, all its readers are to consider themselves saluted;
Essays on Life

at any rate, these good fellows, in the effusiveness of their hearts, actually wrote the above in pencil. I was sorely tempted to steal it, but, after copying it, left it in the Chief Priest's hands instead.
ART IN THE VALLEY OF SAAS

HAVING been told by Mr. Fortescue, of the British Museum, that there were some chapels at Saas-Fée which bore analogy to those at Varallo, described in my book "Ex Voto," I went to Saas during this last summer, and venture now to lay my conclusions before the reader.

The chapels are fifteen in number, and lead up to a larger and singularly graceful one, rather more than half-way between Saas and Saas-Fée. This is commonly but wrongly called the chapel of St. Joseph, for it is dedicated to the Virgin, and its situation is of such extreme beauty—the great Fée glaciers showing through the open portico—that it is in itself worth a pilgrimage. It is surrounded by noble larches and overhung by rock; in front of the portico there is a small open space covered with grass, and a huge

1 Published in the Universal Review, November 1890.
2 Longmans & Co., 1890.
larch, the stem of which is girt by a rude stone seat. The portico itself contains seats for worshippers, and a pulpit from which the preacher's voice can reach the many who must stand outside. The walls of the inner chapel are hung with votive pictures, some of them very quaint and pleasing, and not overweighed by those qualities that are usually dubbed by the name of artistic merit. Innumerable wooden and waxen representations of arms, legs, eyes, ears and babies tell of the cures that have been effected during two centuries of devotion, and can hardly fail to awaken a kindly sympathy with the long dead and forgotten folks who placed them where they are.

The main interest, however, despite the extreme loveliness of the St. Mary's Chapel, centres rather in the small and outwardly unimportant oratories (if they should be so called) that lead up to it. These begin immediately with the ascent from the level ground on which the village of Saas-im-Grund is placed, and contain scenes in the history of the Redemption, represented by rude but
spirited wooden figures, each about two feet high, painted, gilt, and rendered as life-like in all respects as circumstances would permit. The figures have suffered a good deal from neglect, and are still not a little misplaced. With the assistance, however, of the Rev. E. J. Selwyn, English Chaplain at Saas-im-Grund, I have been able to replace many of them in their original positions, as indicated by the parts of the figures that are left rough-hewn and unpainted. They vary a good deal in interest, and can be easily sneered at by those who make a trade of sneering. Those, on the other hand, who remain unsophisticated by overmuch art-culture will find them full of character in spite of not a little rudeness of execution, and will be surprised at coming across such works in a place so remote from any art-centre as Saas must have been at the time these chapels were made. It will be my business therefore to throw what light I can upon the questions how they came to be made at all, and who was the artist who designed them.

The only documentary evidence consists in
Essays on Life

a chronicle of the valley of Saas written in the early years of this century by the Rev. Peter Jos. Ruppen, and published at Sion in 1851. This work makes frequent reference to a manuscript by the Rev. Peter Joseph Clemens Lommatter, curé of Saas-Fée from 1738 to 1751, which has unfortunately been lost, so that we have no means of knowing how closely it was adhered to. The Rev. Jos. Ant. Ruppen, the present excellent curé of Saas-im-Grund, assures me that there is no reference to the Saas-Fée oratories in the "Actes de l’Eglise" at Saas, which I understand go a long way back; but I have not seen these myself. Practically, then, we have no more documentary evidence than is to be found in the published chronicle above referred to.

We there find it stated that the large chapel, commonly, but as above explained, wrongly called St. Joseph’s, was built in 1687, and enlarged by subscription in 1747. These dates appear on the building itself, and are no doubt accurate. The writer adds that there was no actual edifice on this site before
Art and Science

the one now existing was built, but there was a miraculous picture of the Virgin placed in a mural niche, before which the pious herdsmen and devout inhabitants of the valley worshipped under the vault of heaven. A miraculous (or miracle-working) picture was always more or less rare and important; the present site, therefore, seems to have been long one of peculiar sanctity. Possibly the name Fée may point to still earlier Pagan mysteries on the same site.

As regards the fifteen small chapels, the writer says they illustrate the fifteen mysteries of the Psalter, and were built in 1709, each

"1709 wurden die kleinen Kapellelein die 15 Geheimnisse des Psalters vorstellend auf dem Wege zur hohen Stiege gebaut. Jeder Haushalter des Viertels Fée übernahm den Bau eines dieser Geheimnisskapellen, und ein besonderer Gutthäuter dieser frommen Unternehmung war Heinrich Andenmatten, nachher Bruder der Gesellschaft Jesu."
householder of the Saas-Fée contributing one chapel. He adds that Heinrich Andenmatten, afterwards a brother of the Society of Jesus, was an especial benefactor or promoter of the undertaking. One of the chapels, the Ascension (No. 12 of the series), has the date 1709 painted on it; but there is no date on any other chapel, and there seems no reason why this should be taken as governing the whole series.

Over and above this, there exists in Saas a tradition, as I was told immediately on my arrival, by an English visitor, that the chapels were built in consequence of a flood, but I have vainly endeavoured to trace this story to an indigenous source.

The internal evidence of the wooden figures themselves—nothing analogous to which, it should be remembered, can be found in the chapel of 1687—points to a much earlier date. I have met with no school of sculpture belonging to the early part of the eighteenth century to which they can be plausibly assigned; and the supposition that they are the work of some unknown local genius who was not
Art and Science

led up to and left no successors may be dismissed, for the work is too scholarly to have come from any one but a trained sculptor. I refer of course to those figures which the artist must be supposed to have executed with his own hand, as, for example, the central figure of the Crucifixion group and those of the Magdalene and St. John. The greater number of the figures were probably, as was suggested to me by Mr. Ranshaw, of Lowth, executed by a local woodcarver from models in clay and wax furnished by the artist himself. Those who examine the play of line in the hair, mantle, and sleeve of the Magdalene in the Crucifixion group, and contrast it with the greater part of the remaining draperies, will find little hesitation in concluding that this was the case, and will ere long readily distinguish the two hands from which the figures have mainly come. I say "mainly," because there is at least one other sculptor who may well have belonged to the year 1709, but who fortunately has left us little. Examples of his work may perhaps be seen in the nearest villain with a big hat in the
Essays on Life

Flagellation chapel, and in two cherubs in the Assumption of the Virgin.

We may say, then, with some certainty, that the designer was a cultivated and practised artist. We may also not less certainly conclude that he was of Flemish origin, for the horses in the Journey to Calvary and Crucifixion chapels, where alone there are any horses at all, are of Flemish breed, with no trace of the Arab blood adopted by Gaudenzio at Varallo. The character, moreover, of the villains is Northern—of the Quentin Matsys, Martin Schongauer type, rather than Italian; the same sub-Rubensesque feeling which is apparent in more than one chapel at Varallo is not less evident here—especially in the Journey to Calvary and Crucifixion chapels. There can hardly, therefore, be a doubt that the artist was a Fleming who had worked for several years in Italy.

It is also evident that he had Tabachetti's work at Varallo well in his mind. For not only does he adopt certain details of costume (I refer particularly to the treatment of soldiers' tunics) which are peculiar to
Art and Science

Tabachetti at Varallo, but whenever he treats a subject which Tabachetti had treated at Varallo, as in the Flagellation, Crowning with Thorns, and Journey to Calvary chapels, the work at Saas is evidently nothing but a somewhat modified abridgement of that at Varallo. When, however, as in the Annunciation, the Nativity, the Crucifixion, and other chapels, the work at Varallo is by another than Tabachetti, no allusion is made to it. The Saas artist has Tabachetti's Varallo work at his finger-ends, but betrays no acquaintance whatever with Gaudenzio Ferrari, Gio. Ant. Paracca, or Giovanni D'Enrico.

Even, moreover, when Tabachetti's work at Varallo is being most obviously drawn from, as in the Journey to Calvary chapel, the Saas version differs materially from that at Varallo, and is in some respects an improvement on it. The idea of showing other horsemen and followers coming up from behind, whose heads can be seen over the crown of the interposing hill, is singularly effective as suggesting a number of others that are unseen, nor can I conceive that any
one but the original designer would follow Tabachetti’s Varallo design with as much closeness as it has been followed here, and yet make such a brilliantly successful modification. The stumbling, again, of one horse (a detail almost hidden, according to Tabachetti’s wont) is a touch which Tabachetti himself might add, but which no Saas wood-carver who was merely adapting from a reminiscence of Tabachetti’s Varallo chapel would be likely to introduce. These considerations have convinced me that the designer of the chapels at Saas is none other than Tabachetti himself, who, as has been now conclusively shown, was a native of Dinant, in Belgium.

The Saas chronicler, indeed, avers that the chapels were not built till 1709—a statement apparently corroborated by a date now visible on one chapel; but we must remember that the chronicler did not write until a century or so later than 1709, and though, indeed, his statement may have been taken from the lost earlier manuscript of 1738, we know nothing about this either one way or the other. The
Art and Science

writer may have gone by the still existing 1709 on the Ascension chapel, whereas this date may in fact have referred to a restoration, and not to an original construction. There is nothing, as I have said, in the choice of the chapel on which the date appears, to suggest that it was intended to govern the others. I have explained that the work is isolated and exotic. It is by one in whom Flemish and Italian influences are alike equally predominant; by one who was saturated with Tabachetti's Varallo work, and who can improve upon it, but over whom the other Varallo sculptors have no power. The style of the work is of the sixteenth and not of the eighteenth century—with a few obvious exceptions that suit the year 1709 exceedingly well. Against such considerations as these, a statement made at the beginning of this century referring to a century earlier, and a promiscuous date upon one chapel, can carry but little weight. I shall assume, therefore, henceforward, that we have here groups designed in a plastic material by Tabachetti, and reproduced in wood by the best local
Essays on Life

wood-sculptor available, with the exception of a few figures cut by the artist himself.

We ask, then, at what period in his life did Tabachetti design these chapels, and what led to his coming to such an out-of-the-way place as Saas at all? We should remember that, according both to Fassola and Torrotti (writing in 1671 and 1686 respectively), Tabachetti\(^1\) became insane about the year 1586 or early in 1587, after having just begun the Salutation chapel. I have explained in "Ex Voto" that I do not believe this story. I have no doubt that Tabachetti was declared to be mad, but I believe this to have been due to an intrigue, set on foot in order to get a

\(^1\) The story of Tabachetti's incarceration is very doubtful. Cavaliere F. Negri, to whose book on Tabachetti and his work at Crea I have already referred the reader, does not mention it. Tabachetti left his native Dinant in 1585, and from that date until his death in 1615 he appears to have worked chiefly at Varallo and Crea. There is a document in existence stating that in 1588 he executed a statue for the hermitage of S. Rocco, at Crea, which, if it is to be relied on, disposes both of the incarceration and of the visit to Saas. It is possible, however, that the date is 1598, in which case Butler's theory of the visit to Saas may hold good. In 1590 Tabachetti was certainly at Varallo, and again in 1594, 1599, and 1602. He died in 1615, possibly during a visit to Varallo, though his home at that time was Costigliole, near Asti.—R. A. S.
foreign artist out of the way, and to secure the Massacre of the Innocents chapel, at that precise time undertaken, for Gio. Ant. Paracca, who was an Italian.

Or he may have been sacrificed in order to facilitate the return of the workers in stucco whom he had superseded on the Sacro Monte. He may have been goaded into some imprudence which was seized upon as a pretext for shutting him up; at any rate, the fact that when in 1587 he inherited his father’s property at Dinant, his trustee (he being expressly stated to be “expatrié”) was “datif,” “dativus,” appointed not by himself but by the court, lends colour to the statement that he was not his own master at the time; for in later kindred deeds, now at Namur, he appoints his own trustee. I suppose, then, that Tabachetti was shut up in a madhouse at Varallo for a considerable time, during which I can find no trace of him, but that eventually he escaped or was released.

Whether he was a fugitive, or whether he was let out from prison, he would in either case, in all reasonable probability, turn his face
homeward. If he was escaping, he would make immediately for the Savoy frontier, within which Saas then lay. He would cross the Baranca above Fobello, coming down on to Ponte Grande in the Val Anzasca. He would go up the Val Anzasca to Macugnaga, and over the Monte Moro, which would bring him immediately to Saas. Saas, therefore, is the nearest and most natural place for him to make for, if he were flying from Varallo, and here I suppose him to have halted.

It so happened that on the 9th of September, 1589, there was one of the three great outbreaks of the Mattmark See that have from time to time devastated the valley of Saas.\(^1\) It is probable that the chapels were decided upon in consequence of some grace shown by the miraculous picture of the Virgin, which had mitigated a disaster occurring so soon after

\(^1\) This is thus chronicled by M. Ruppen: "1589 den 9 September war eine Wassergrösse, die viel Schaden verursachte. Die Thalstrasse, die von den Steinmatten an bis zur Kirche am Ufer der Visp lag, wurde ganz zerstört. Man ward gezwungen eine neue Strasse in einiger Entfernung vom Wasser durch einen alten Fussweg auszuhauen welche vier und einerhalben Viertel der Klafter, oder 6 Schuh und 9 Zoll breit sollte." (p. 43).
the anniversary of her own Nativity. Tabachetti, arriving at this juncture, may have offered to undertake them if the Saas people would give him an asylum. Here, at any rate, I suppose him to have stayed till some time in 1590, probably the second half of it; his design of eventually returning home, if he ever entertained it, being then interrupted by a summons to Crea near Casale, where I believe him to have worked with a few brief interruptions thenceforward for little if at all short of half a century, or until about the year 1640. I admit, however, that the evidence for assigning him so long a life rests solely on the supposed identity of the figure known as "Il Vecchietto," in the Varallo Descent from the Cross chapel, with the portrait of Tabachetti himself in the Ecce Homo chapel, also at Varallo.

I find additional reason for thinking the chapels owe their origin to the inundation of September 9, 1589, in the fact that the 8th of September is made a day of pilgrimage to the Saas-Fée chapels throughout the whole valley of Saas. It is true the 8th of September
Essays on Life

is the festival of the Nativity of the Virgin Mary, so that under any circumstances this would be a great day, but the fact that not only the people of Saas, but the whole valley down to Visp, flock to this chapel on the 8th of September, points to the belief that some special act of grace on the part of the Virgin was vouchsafed on this day in connection with this chapel. A belief that it was owing to the intervention of St. Mary of Fée that the inundation was not attended with loss of life would be very likely to lead to the foundation of a series of chapels leading up to the place where her miraculous picture was placed, and to the more special celebration of her Nativity in connection with this spot throughout the valley of Saas. I have discussed the subject with the Rev. Jos. Ant. Ruppen, and he told me he thought the fact that the great fête of the year in connection with the Saas-Fée chapels was on the 8th of September pointed rather strongly to the supposition that there was a connection between these and the recorded flood of September 9, 1589.
Art and Science

Turning to the individual chapels they are as follows:—

1. The Annunciation. The treatment here presents no more analogy to that of the same subject at Varallo than is inevitable in the nature of the subject. The Annunciation figures at Varallo have proved to be mere draped dummies with wooden heads; Taba-chetti, even though he did the heads, which he very likely did, would take no interest in the Varallo work with the same subject. The Annunciation, from its very simplicity as well as from the transcendental nature of the subject, is singularly hard to treat, and the work here, whatever it may once have been, is now no longer remarkable.

2. The Salutation of Mary by Elizabeth. This group, again, bears no analogy to the Salutation chapel at Varallo, in which Taba-chetti’s share was so small that it cannot be considered as in any way his. It is not to be expected, therefore, that the Saas chapel should follow the Varallo one. The figures, four in number, are pleasing and well arranged. St. Joseph, St. Elizabeth, and St. Zacharias
are all talking at once. The Virgin is alone silent.

3. The Nativity is much damaged and hard to see. The treatment bears no analogy to that adopted by Gaudenzio Ferrari at Varallo. There is one pleasing young shepherd standing against the wall, but some figures have no doubt (as in others of the chapels) disappeared, and those that remain have been so shifted from their original positions that very little idea can be formed of what the group was like when Tabachetti left it.

4. The Purification. I can hardly say why this chapel should remind me, as it does, of the Circumcision chapel at Varallo, for there are more figures here than space at Varallo will allow. It cannot be pretended that any single figure is of extraordinary merit, but amongst them they tell their story with excellent effect. Two, those of St. Joseph and St. Anna (?), that doubtless were once more important factors in the drama, are now so much in corners near the window that they can hardly be seen.

5. The Dispute in the Temple. This subject
is not treated at Varallo. Here at Saas there are only six doctors now; whether or no there were originally more cannot be determined.

6. The Agony in the Garden. Tabachetti had no chapel with this subject at Varallo, and there is no resemblance between the Saas chapel and that by D'Enrico. The figures are no doubt approximately in their original positions, but I have no confidence that I have rearranged them correctly. They were in such confusion when I first saw them that the Rev. E. J. Selwyn and myself determined to rearrange them. They have doubtless been shifted more than once since Tabachetti left them. The sleeping figures are all good. St. James is perhaps a little prosaic. One Roman soldier who is coming into the garden with a lantern, and motioning silence with his hand, does duty for the others that are to follow him. I should think more than one of these figures is actually carved in wood by Tabachetti, allowance being made for the fact that he was working in a material with which he was not familiar, and which no sculptor of the highest rank has ever found congenial.
7. The Flagellation. Tabachetti has a chapel with this subject at Varallo, and the Saas group is obviously a descent with modification from his work there. The figure of Christ is so like the one at Varallo that I think it must have been carved by Tabachetti himself. The man with the hooked nose, who at Varallo is stooping to bind his rods, is here upright: it was probably the intention to emphasise him in the succeeding scenes as well as this, in the same way as he has been emphasised at Varallo, but his nose got pared down in the cutting of later scenes, and could not easily be added to. The man binding Christ to the column at Varallo is repeated (longo intervallo) here, and the whole work is one inspired by that at Varallo, though no single figure except that of the Christ is adhered to with any very great closeness. I think the nearer malefactor, with a goitre, and wearing a large black hat, is either an addition of the year 1709, or was done by the journeyman of the local sculptor who carved the greater number of the figures. The man stooping down to bind his rods can hardly be by the same hand as either of the
two black-hatted malefactors, but it is impossible to speak with certainty. The general effect of the chapel is excellent, if we consider the material in which it is executed, and the rudeness of the audience to whom it addresses itself.

8. The Crowning with Thorns. Here again the inspiration is derived from Tabachetti’s Crowning with Thorns at Varallo. The Christs in the two chapels are strikingly alike, and the general effect is that of a residuary impression left in the mind of one who had known the Varallo Flagellation exceedingly well.

9. Sta. Veronica. This and the next succeeding chapels are the most important of the series. Tabachetti’s Journey to Calvary at Varallo is again the source from which the present work was taken, but, as I have already said, it has been modified in reproduction. Mount Calvary is still shown, as at Varallo, towards the left-hand corner of the work, but at Saas it is more towards the middle than at Varallo, so that horsemen and soldiers may be seen coming up behind it—a stroke that
Essays on Life

deserves the name of genius none the less for the manifest imperfection with which it has been carried into execution. There are only three horses fully shown, and one partly shown. They are all of the heavy Flemish type adopted by Tabachetti at Varallo. The man kicking the fallen Christ and the goitred man (with the same teeth missing), who are so conspicuous in the Varallo Journey to Calvary, reappear here, only the kicking man has much less nose than at Varallo, probably because (as explained) the nose got whittled away and could not be whittled back again. I observe that the kind of lapelled tunic which Tabachetti, and only Tabachetti, adopts at Varallo, is adopted for the centurion in this chapel, and indeed throughout the Saas chapels this particular form of tunic is the most usual for a Roman soldier. The work is still a very striking one, notwithstanding its translation into wood and the decay into which it has been allowed to fall; nor can it fail to impress the visitor who is familiar with this class of art as coming from a man of extraordinary dramatic power and command over the almost
impossible art of composing many figures together effectively in all-round sculpture. Whether all the figures are even now as Tabachetti left them I cannot determine, but Mr. Selwyn has restored Simon the Cyrenian to the position in which he obviously ought to stand, and between us we have got the chapel into something more like order.

10. The Crucifixion. This subject was treated at Varallo not by Tabachetti but by Gaudenzio Ferrari. It confirms therefore my opinion as to the designer of the Saas chapels to find in them no trace of the Varallo Crucifixion, while the kind of tunic which at Varallo is only found in chapels wherein Tabachetti worked again appears here. The work is in a deplorable state of decay. Mr. Selwyn has greatly improved the arrangement of the figures, but even now they are not, I imagine, quite as Tabachetti left them. The figure of Christ is greatly better in technical execution than that of either of the two thieves; the folds of the drapery alone will show this even to an unpractised eye. I do not think there can be a doubt but that Tabachetti cut this
figure himself, as also those of the Magdalene and St. John, who stand at the foot of the cross. The thieves are coarsely executed, with no very obvious distinction between the penitent and the impenitent one, except that there is a fiend painted on the ceiling over the impenitent thief. The one horse introduced into the composition is again of the heavy Flemish type adopted by Tabachetti at Varallo. There is great difference in the care with which the folds on the several draperies have been cut, some being stiff and poor enough, while others are done very sufficiently. In spite of smallness of scale, ignoble material, disarrangement and decay, the work is still striking.

11. The Resurrection. There being no chapel at Varallo with any of the remaining subjects treated at Saas, the sculptor has struck out a line for himself. The Christ in the Resurrection Chapel is a carefully modelled figure, and if better painted might not be ineffective. Three soldiers, one sleeping, alone remain. There were probably other figures that have been lost. The sleeping soldier is very pleasing.
12. The Ascension is not remarkably interesting; the Christ appears to be, but perhaps is not, a much more modern figure than the rest.

13. The Descent of the Holy Ghost. Some of the figures along the end wall are very good, and were, I should imagine, cut by Tabachetti himself. Those against the two side walls are not so well cut.

14. The Assumption of the Virgin Mary. The two large cherubs here are obviously by a later hand, and the small ones are not good. The figure of the Virgin herself is unexceptionable. There were doubtless once other figures of the Apostles which have disappeared; of these a single St. Peter (?), so hidden away in a corner near the window that it can only be seen with difficulty, is the sole survivor.

15. The Coronation of the Virgin is of later date, and has probably superseded an earlier work. It can hardly be by the designer of the other chapels of the series. Perhaps Tabachetti had to leave for Crea before all the chapels at Saas were finished.

Lastly, we have the larger chapel dedicated
Essays on Life

to St. Mary, which crowns the series. Here there is nothing of more than common artistic interest, unless we except the stone altar mentioned in Ruppen's chronicle. This is of course classical in style, and is, I should think, very good.

Once more I must caution the reader against expecting to find highly-finished gems of art in the chapels I have been describing. A wooden figure not more than two feet high clogged with many coats of paint can hardly claim to be taken very seriously, and even those few that were cut by Tabachetti himself were not meant to have attention concentrated on themselves alone. As mere wood-carving the Saas-Fée chapels will not stand comparison, for example, with the triptych of unknown authorship in the Church of St. Anne at Gliss, close to Brieg. But, in the first place, the work at Gliss is worthy of Holbein himself: I know no wood-carving that can so rivet the attention; moreover it is coloured with water-colour and not oil, so that it is tinted, not painted; and, in the second place, the Gliss triptych belongs to a date (1519) when artists
Art and Science

held neither time nor impressionism as objects, and hence, though greatly better than the Saas-Fée chapels as regards a certain Japanese curiousness of finish and naïveté of literal transcription, it cannot even enter the lists with the Saas work as regards élan and dramatic effectiveness. The difference between the two classes of work is much that between, say, John Van Eyck or Memling and Rubens or Rembrandt, or, again, between Giovanni Bellini and Tintoretto; the aims of the one class of work are incompatible with those of the other. Moreover, in the Gliss triptych the intention of the designer is carried out (whether by himself or no) with admirable skill; whereas at Saas the wisdom of the workman is rather of Ober-Ammergau than of the Egyptians, and the voice of the poet is not a little drowned in that of his mouthpiece. If, however, the reader will bear in mind these somewhat obvious considerations, and will also remember the pathetic circumstances under which the chapels were designed—for Tabachetti when he reached Saas was no doubt shattered in body and mind by his four years’ imprison-
ment—he will probably be not less attracted to them than I observed were many of the visitors both at Saas-Grund and Saas-Fée with whom I had the pleasure of examining them.

I will now run briefly through the other principal works in the neighbourhood to which I think the reader would be glad to have his attention directed.

At Saas-Fée itself the main altar-piece is without interest, as also one with a figure of St. Sebastian. The Virgin and Child above the remaining altar are, so far as I remember them, very good, and greatly superior to the smaller figures of the same altar-piece.

At Almagel, an hour's walk or so above Saas-Grund—a village, the name of which, like those of the Alphubel, the Monte Moro, and more than one other neighbouring site, is supposed to be of Saracenic origin—the main altar-piece represents a female saint with folded arms being beheaded by a vigorous man to the left. These two figures are very good. There are two somewhat inferior elders to the right, and the composition is crowned by the Assumption of the Virgin. I like the work, but have
Art and Science

no idea who did it. Two bishops flanking the composition are not so good. There are two other altars in the church: the right-hand one has some pleasing figures, not so the left-hand.

In St. Joseph's Chapel, on the mule-road between Saas-Grund and Saas-Fée, the St. Joseph and the two children are rather nice. In the churches and chapels which I looked into between Saas and Stalden, I saw many florid extravagant altar-pieces, but nothing that impressed me favourably.

In the parish church at Saas-Grund there are two altar-pieces which deserve attention. In the one over the main altar the arrangement of the Last Supper in a deep recess half-way up the composition is very pleasing and effective; in that above the right-hand altar of the two that stand in the body of the church there are a number of round lunettes, about eight inches in diameter, each containing a small but spirited group of wooden figures. I have lost my notes on these altar-pieces and can only remember that the main one has been restored, and now belongs to two different dates, the earlier date being, I should imagine,
Essays on Life

about 1670. A similar treatment of the Last Supper may be found near Brieg in the church of Naters, and no doubt the two altar-pieces are by the same man. There are, by the way, two very ambitious altars on either side the main arch leading to the chancel in the church at Naters, of which the one on the south side contains obvious reminiscences of Gaudenzio Ferrari's Sta. Maria frescoes at Varallo; but none of the four altar-pieces in the two transepts tempted me to give them much attention. As regards the smaller altar-piece at Saas-Grund, analogous work may be found at Cravagliana, half-way between Varallo and Fobello, but this last has suffered through the inveterate habit which Italians have of showing their hatred towards the enemies of Christ by mutilating the figures that represent them. Whether the Saas work is by a Valsesian artist who came over to Switzerland, or whether the Cravagliana work is by a Swiss who had come to Italy, I cannot say without further consideration and closer examination than I have been able to give. The altar-pieces of Mai-rieng, Chiggiogna, and, I am told, Lavertezzo,
all in the Canton Ticino, are by a Swiss or German artist who has migrated southward; but the reverse migration was equally common.

Being in the neighbourhood, and wishing to assure myself whether the sculptor of the Saas-Fée chapels had or had not come lower down the valley, I examined every church and village which I could hear of as containing anything that might throw light on this point. I was thus led to Vispertimenen, a village some three hours above either Visp or Stalden. It stands very high, and is an almost untouched example of a mediæval village. The altar-piece of the main church is even more floridly ambitious in its abundance of carving and gilding than the many other ambitious altar-pieces with which the Canton Valais abounds. The Apostles are receiving the Holy Ghost on the first storey of the composition, and they certainly are receiving it with an overjoyed alacrity and hilarious ecstasy of allegria spirituale which it would not be easy to surpass. Above the village, reaching almost to the limits beyond which there is no cultivation, there stands a series of chapels
like those I have been describing at Saas-Fée, only much larger and more ambitious. They are twelve in number, including the church that crowns the series. The figures they contain are of wood (so I was assured, but I did not go inside the chapels): they are life-size, and in some chapels there are as many as a dozen figures. I should think they belonged to the later half of the last century, and here, one would say, sculpture touches the ground; at least, it is not easy to see how cheap exaggeration can sink an art more deeply. The only things that at all pleased me were a smiling donkey and an ecstatic cow in the Nativity chapel. Those who are not allured by the prospect of seeing perhaps the very worst that can be done in its own line, need not be at the pains of climbing up to Vispertimenen. Those, on the other hand, who may find this sufficient inducement will not be disappointed, and they will enjoy magnificent views of the Weisshorn and the mountains near the Dom.

I have already referred to the triptych at Gliss. This is figured in Wolf's work on
Art and Science

Chamonix and the Canton Valais, but a larger and clearer reproduction of such an extraordinary work is greatly to be desired. The small wooden statues above the triptych, as also those above its modern companion in the south transept, are not less admirable than the triptych itself. I know of no other like work in wood, and have no clue whatever as to who the author can have been beyond the fact that the work is purely German and eminently Holbeinesque in character.

I was told of some chapels at Rarogne, five or six miles lower down the valley than Visp. I examined them, and found they had been stripped of their figures. The few that remained satisfied me that we have had no loss. Above Brieg there are two other like series of chapels. I examined the higher and more promising of the two, but found not one single figure left. I was told by my driver that the other series, close to the Pont Napoléon on the Simplon road, had been also stripped of its figures, and, there being a heavy storm at the time, have taken his word for it that this was so.
THOUGHT AND LANGUAGE

Three well-known writers, Professor Max Müller, Professor Mivart, and Mr. Alfred Russel Wallace have lately maintained that though the theory of descent with modification accounts for the development of all vegetable life, and of all animals lower than man, yet that man cannot—not at least in respect of the whole of his nature—be held to have descended from any animal lower than himself, inasmuch as none lower than man possesses even the germs of language. Reason, it is contended—more especially by Professor Max Müller in his "Science of Thought," to which I propose confining our attention this evening—is so inseparably connected with language, that the two are in point of fact identical; hence it is argued that, as the lower animals have no germs of language, they can

1 A lecture delivered at the Working Men's College in Great Ormond Street, March 15, 1890; rewritten and delivered again at the Somerville Club, February 13, 1894.
Art and Science

have no germs of reason, and the inference is drawn that man cannot be conceived as having derived his own reasoning powers and command of language through descent from beings in which no germ of either can be found. The relations therefore between thought and language, interesting in themselves, acquire additional importance from the fact of their having become the battle-ground between those who say that the theory of descent breaks down with man, and those who maintain that we are descended from some ape-like ancestor long since extinct.

The contention of those who refuse to admit man unreservedly into the scheme of evolution is comparatively recent. The great propounders of evolution, Buffon, Erasmus Darwin and Lamarck—not to mention a score of others who wrote at the close of the last and early part of this present century—had no qualms about admitting man into their system. They have been followed in this respect by the late Mr. Charles Darwin, and by the greatly more influential part of our modern biologists, who hold that whatever
loss of dignity we may incur through being proved to be of humble origin, is compensated by the credit we may claim for having advanced ourselves to such a high pitch of civilisation; this bids us expect still further progress, and glorifies our descendants more than it abases our ancestors. But to whichever view we may incline on sentimental grounds the fact remains that, while Charles Darwin declared language to form no impassable barrier between man and the lower animals, Professor Max Müller calls it the Rubicon which no brute dare cross, and deduces hence the conclusion that man cannot have descended from an unknown but certainly speechless ape.

It may perhaps be expected that I should begin a lecture on the relations between thought and language with some definition of both these things; but thought, as Sir William Grove said of motion, is a phenomenon "so obvious to simple apprehension, that to define it would make it more obscure." ¹ Definitions are useful where things are new to us, but they are superfluous about those that are

¹ "Correlation of Forces" : Longmans, 1874, p. 15.
178
Art and Science

already familiar, and mischievous, so far as they are possible at all, in respect of all those things that enter so profoundly and intimately into our being that in them we must either live or bear no life. To vivisect the more vital processes of thought is to suspend, if not to destroy them; for thought can think about everything more healthily and easily than about itself. It is like its instrument the brain, which knows nothing of any injuries inflicted upon itself. As regards what is new to us, a definition will sometimes dilute a difficulty, and help us to swallow that which might choke us undiluted; but to define when we have once well swallowed is to unsettle, rather than settle, our digestion. Definitions, again, are like steps cut in a steep slope of ice, or shells thrown on to a greasy pavement; they give us foothold, and enable us to advance, but when we are at our journey's end we want them no longer. Again, they are useful as mental fluxes, and as helping us to fuse new ideas with our older ones. They present us with some tags and ends of ideas that we have already mastered, on to which we can
hitch our new ones; but to multiply them in respect of such a matter as thought, is like scratching the bite of a gnat; the more we scratch the more we want to scratch; the more we define the more we shall have to go on defining the words we have used in our definitions, and shall end by setting up a serious mental raw in the place of a small uneasiness that was after all quite endurable. We know too well what thought is, to be able to know that we know it, and I am persuaded there is no one in this room but understands what is meant by thought and thinking well enough for all the purposes of this discussion. Whoever does not know this without words will not learn it for all the words and definitions that are laid before him. The more, indeed, he hears, the more confused he will become. I shall, therefore, merely premise that I use the word "thought" in the same sense as that in which it is generally used by people who say that they think this or that. At any rate, it will be enough if I take Professor Max Müller's own definition, and say that its essence consists in a bringing
Art and Science

together of mental images and ideas with deductions therefrom, and with a corresponding power of detaching them from one another. Hobbes, the Professor tells us, maintained this long ago, when he said that all our thinking consists of addition and subtraction—that is to say, in bringing ideas together, and in detaching them from one another.

Turning from thought to language, we observe that the word is derived from the French langue, or tongue. Strictly, therefore, it means tonguage. This, however, takes account of but a very small part of the ideas that underlie the word. It does, indeed, seize a familiar and important detail of everyday speech, though it may be doubted whether the tongue has more to do with speaking than lips, teeth and throat have, but it makes no attempt at grasping and expressing the essential characteristic of speech. Anything done with the tongue, even though it involve no speaking at all, is tonguage; eating oranges is as much tonguage as speech is. The word, therefore, though it tells us in part how speech is effected, reveals nothing of that ulterior mean-
Essays on Life

ing which is nevertheless inseparable from any right use of the words either "speech" or "language." It presents us with what is indeed a very frequent adjunct of conversation, but the use of written characters, or the finger-speech of deaf mutes, is enough to show that the word "language" omits all reference to the most essential characteristics of the idea, which in practice it nevertheless very sufficiently presents to us. I hope presently to make it clear to you how and why it should do so. The word is incomplete in the first place, because it omits all reference to the ideas which words, speech or language are intended to convey, and there can be no true word without its actually or potentially conveying an idea. Secondly, it makes no allusion to the person or persons to whom the ideas are to be conveyed. Language is not language unless it not only expresses fairly definite and coherent ideas, but unless it also conveys these ideas to some other living intelligent being, either man or brute, that can understand them. We may speak to a dog or horse, but not to a stone. If we make pretence of doing so we
Art and Science

are in reality only talking to ourselves. The person or animal spoken to is half the battle—a half, moreover, which is essential to there being any battle at all. It takes two people to say a thing—a sayee as well as a sayer. The one is as essential to any true saying as the other. A. may have spoken, but if B. has not heard, there has been nothing said, and he must speak again. True, the belief on A.’s part that he had a bonâ fide sayee in B., saves his speech quà him, but it has been barren and left no fertile issue. It has failed to fulfil the conditions of true speech, which involve not only that A. should speak, but also that B. should hear. True, again, we often speak of loose, incoherent, indefinite language; but by doing so we imply, and rightly, that we are calling that language which is not true language at all. People, again, sometimes talk to themselves without intending that any other person should hear them, but this is not well done, and does harm to those who practise it. It is abnormal, whereas our concern is with normal and essential characteristics; we may, therefore, neglect both delirious
Essays on Life

babblings, and the cases in which a person is regarding him or herself, as it were, from outside, and treating himself as though he were some one else.

Inquiring, then, what are the essentials, the presence of which constitutes language, while their absence negatives it altogether, we find that Professor Max Müller restricts them to the use of grammatical articulate words that we can write or speak, and denies that anything can be called language unless it can be written or spoken in articulate words and sentences. He also denies that we can think at all unless we do so in words; that is to say, in sentences with verbs and nouns. Indeed he goes so far as to say upon his title-page that there can be no reason—which I imagine comes to much the same thing as thought—without language, and no language without reason.

Against the assertion that there can be no true language without reason I have nothing to say. But when the Professor says that there can be no reason, or thought, without language, his opponents contend, as it seems
Art and Science

to me, with greater force, that thought, though
infinitely aided, extended and rendered definite
through the invention of words, nevertheless
existed so fully as to deserve no other name
thousands, if not millions of years before
words had entered into it at all. Words,
they say, are a comparatively recent inven-
tion, for the fuller expression of something
that was already in existence.

Children, they urge, are often evidently
thinking and reasoning, though they can
neither think nor speak in words. If you
ask me to define reason, I answer as before
that this can no more be done than thought,
truth or motion can be defined. Who has
answered the question, "What is truth?"
Man cannot see God and live. We cannot
go so far back upon ourselves as to under-
mine our own foundations; if we try to do
so we topple over, and lose that very reason
about which we vainly try to reason. If we
let the foundations be, we know well enough
that they are there, and we can build upon
them in all security. We cannot, then, define
reason nor crib, cabin and confine it within a

185
thus-far-shalt-thou-go-and-no-further. Who can define heat or cold, or night or day? Yet, so long as we hold fast by current consent, our chances of error for want of better definition are so small that no sensible person will consider them. In like manner, if we hold by current consent or common sense, which is the same thing, about reason, we shall not find the want of an academic definition hinder us from a reasonable conclusion. What nurse or mother will doubt that her infant child can reason within the limits of its own experience, long before it can formulate its reason in articulately worded thought? If the development of any given animal is, as our opponents themselves admit, an epitome of the history of its whole anterior development, surely the fact that speech is an accomplishment acquired after birth so artificially that children who have gone wild in the woods lose it if they have ever learned it, points to the conclusion that man's ancestors only learned to express themselves in articulate language at a comparatively recent period. Granted that they learn
to think and reason continually the more and more fully for having done so, will common sense permit us to suppose that they could neither think nor reason at all till they could convey their ideas in words?

I will return later to the reason of the lower animals, but will now deal with the question what it is that constitutes language in the most comprehensive sense that can be properly attached to it. I have said already that language to be language at all must not only convey fairly definite coherent ideas, but must also convey them to another living being. Whenever two living beings have conveyed and received ideas, there has been language, whether looks or gestures or words spoken or written have been the vehicle by means of which the ideas have travelled. Some ideas crawl, some run, some fly; and in this case words are the wings they fly with, but they are only the wings of thought or of ideas, they are not the thought or ideas themselves, nor yet, as Professor Max Müller would have it, inseparably connected with them. Last summer I was at an inn in Sicily, where there was a
deaf and dumb waiter; he had been born so, and could neither write nor read. What had he to do with words or words with him? Are we to say, then, that this most active, amiable and intelligent fellow could neither think nor reason? One day I had had my dinner and had left the hotel. A friend came in, and the waiter saw him look for me in the place I generally occupied. He instantly came up to my friend, and moved his two forefingers in a way that suggested two people going about together, this meant "your friend"; he then moved his forefingers horizontally across his eyes, this meant, "who wears divided spectacles"; he made two fierce marks over the sockets of his eyes, this meant, "with the heavy eyebrows"; he pulled his chin, and then touched his white shirt, to say that my beard was white. Having thus identified me as a friend of the person he was speaking to, and as having a white beard, heavy eyebrows, and wearing divided spectacles, he made a munching movement with his jaws to say that I had had my dinner; and finally, by making two fingers imitate
walking on the table, he explained that I had gone away. My friend, however, wanted to know how long I had been gone, so he pulled out his watch and looked inquiringly. The man at once slapped himself on the back, and held up the five fingers of one hand, to say it was five minutes ago. All this was done as rapidly as though it had been said in words; and my friend, who knew the man well, understood without a moment's hesitation. Are we to say that this man had no thought, nor reason, nor language, merely because he had not a single word of any kind in his head, which I am assured he had not; for, as I have said, he could not speak with his fingers? Is it possible to deny that a dialogue—an intelligent conversation—had passed between the two men? And if conversation, then surely it is technical and pedantic to deny that all the essential elements of language were present. The signs and tokens used by this poor fellow were as rude an instrument of expression, in comparison with ordinary language, as going on one's hands and knees is in comparison with walking, or as walking
compared with going by train; but it is as great an abuse of words to limit the word "language" to mere words written or spoken, as it would be to limit the idea of a locomotive to a railway engine. This may indeed pass in ordinary conversation, where so much must be suppressed if talk is to be got through at all, but it is intolerable when we are inquiring about the relations between thought and words. To do so is to let words become as it were the masters of thought, on the ground that the fact of their being only its servants and appendages is so obvious that it is generally allowed to go without saying.

If all that Professor Max Müller means to say is, that no animal but man commands an articulate language, with verbs and nouns, or is ever likely to command one (and I question whether in reality he means much more than this), no one will differ from him. No dog or elephant has one word for bread, another for meat, and another for water. Yet, when we watch a cat or dog dreaming, as they often evidently do, can we doubt that the dream is accompanied by a mental image of the thing
Art and Science

that is dreamed of, much like what we experience in dreams ourselves, and much doubtless like the mental images which must have passed through the mind of my deaf and dumb waiter? If they have mental images in sleep, can we doubt that waking, also, they picture things before their mind's eyes, and see them much as we do—too vaguely indeed to admit of our thinking that we actually see the objects themselves, but definitely enough for us to be able to recognise the idea or object of which we are thinking, and to connect it with any other idea, object, or sign that we may think appropriate?

Here we have touched on the second essential element of language. We laid it down, that its essence lay in the communication of an idea from one intelligent being to another; but no ideas can be communicated at all except by the aid of conventions to which both parties have agreed to attach an identical meaning. The agreement may be very informal, and may pass so unconsciously from one generation to another that its existence can only be recognised by the aid of much
introspection, but it will be always there. A sayer, a sayee, and a convention, no matter what, agreed upon between them as inseparably attached to the idea which it is intended to convey—these comprise all the essentials of language. Where these are present there is language; where any of them are wanting there is no language. It is not necessary for the sayee to be able to speak and become a sayer. If he comprehends the sayer—that is to say, if he attaches the same meaning to a certain symbol as the sayer does—if he is a party to the bargain whereby it is agreed upon by both that any given symbol shall be attached invariably to a certain idea, so that in virtue of the principle of associated ideas the symbol shall never be present without immediately carrying the idea along with it, then all the essentials of language are complied with, and there has been true speech though never a word was spoken.

The lower animals, therefore, many of them, possess a part of our own language, though they cannot speak it, and hence do not possess it so fully as we do. They cannot say "bread,"
Art and Science

"meat," or "water," but there are many that readily learn what ideas they ought to attach to these symbols when they are presented to them. It is idle to say that a cat does not know what the cat’s-meat man means when he says "meat." The cat knows just as well, neither better nor worse than the cat’s-meat man does, and a great deal better than I myself understand much that is said by some very clever people at Oxford or Cambridge. There is more true employment of language, more bonâ fide currency of speech, between a sayer and a sayee who understand each other, though neither of them can speak a word, than between a sayer who can speak with the tongues of men and of angels without being clear about his own meaning, and a sayee who can himself utter the same words, but who is only in imperfect agreement with the sayer as to the ideas which the words or symbols that he utters are intended to convey. The nature of the symbols counts for nothing; the gist of the matter is in the perfect harmony between sayer and sayee as to the significance that is to be associated with them.
Professor Max Müller admits that we share with the lower animals what he calls an emotional language, and continues that we may call their interjections and imitations language if we like, as we speak of the language of the eyes or the eloquence of mute nature, but he warns us against mistaking metaphor for fact. It is indeed mere metaphor to talk of the eloquence of mute nature, or the language of winds and waves. There is no intercommunication of mind with mind by means of a covenanted symbol; but it is only an apparent, not a real, metaphor to say that two pairs of eyes have spoken when they have signalled to one another something which they both understand. A schoolboy at home for the holidays wants another plate of pudding, and does not like to apply officially for more. He catches the servant's eye and looks at the pudding; the servant understands, takes his plate without a word, and gets him some. Is it metaphor to say that the boy asked the servant to do this, or is it not rather pedantry to insist on the letter of a bond and deny its spirit, by denying that language passed, on the
Art and Science

ground that the symbols covenanted upon and assented to by both were uttered and received by eyes and not by mouth and ears? When the lady drank to the gentleman only with her eyes, and he pledged with his, was there no conversation because there was neither noun nor verb? Eyes are verbs, and glasses of wine are good nouns enough as between those who understand one another. Whether the ideas underlying them are expressed and conveyed by eyeage or by tonguage is a detail that matters nothing.

But everything we say is metaphorical if we choose to be captious. Scratch the simplest expressions, and you will find the metaphor. Written words are handage, inkage and paperage; it is only by metaphor, or substitution and transposition of ideas, that we can call them language. They are indeed potential language, and the symbols employed presuppose nouns, verbs, and the other parts of speech; but for the most part it is in what we read between the lines that the profounder meaning of any letter is conveyed. There are words unwritten and untranslatable into any
nouns that are nevertheless felt as above, about and underneath the gross material symbols that lie scrawled upon the paper; and the deeper the feeling with which anything is written the more pregnant will it be of meaning which can be conveyed securely enough, but which loses rather than gains if it is squeezed into a sentence, and limited by the parts of speech. The language is not in the words but in the heart-to-heartness of the thing, which is helped by words, but is nearer and farther than they. A correspondent wrote to me once, many years ago, "If I could think to you without words you would understand me better." But surely in this he was thinking to me, and without words, and I did understand him better. . . . So it is not by the words that I am too presumptuously venturing to speak to-night that your opinions will be formed or modified. They will be formed or modified, if either, by something that you will feel, but which I have not spoken, to the full as much as by anything that I have actually uttered. You may say that this borders on mysticism. Perhaps it
Art and Science

does, but there really is some mysticism in nature.

To return, however, to terra firma. I believe I am right in saying that the essence of language lies in the intentional conveyance of ideas from one living being to another through the instrumentality of arbitrary tokens or symbols agreed upon, and understood by both as being associated with the particular ideas in question. The nature of the symbol chosen is a matter of indifference; it may be anything that appeals to human senses, and is not too hot or too heavy; the essence of the matter lies in a mutual covenant that whatever it is it shall stand invariably for the same thing, or nearly so.

We shall see this more easily if we observe the differences between written and spoken language. The written word "stone," and the spoken word, are each of them symbols arrived at in the first instance arbitrarily. They are neither of them more like the other than they are to the idea of a stone which rises before our minds, when we either see or hear the word, or than this idea again is like
Essays on Life

the actual stone itself, but nevertheless the spoken symbol and the written one each alike convey with certainty the combination of ideas to which we have agreed to attach them.

The written symbol is formed with the hand, appeals to the eye, leaves a material trace as long as paper and ink last, can travel as far as paper and ink can travel, and can be imprinted on eye after eye practically ad infinitum both as regards time and space.

The spoken symbol is formed by means of various organs in or about the mouth, appeals to the ear, not the eye, perishes instantly without material trace, and if it lives at all does so only in the minds of those who heard it. The range of its action is no wider than that within which a voice can be heard; and every time a fresh impression is wanted the type must be set up anew.

The written symbol extends infinitely, as regards time and space, the range within which one mind can communicate with another; it gives the writer's mind a life limited by the duration of ink, paper, and readers, as against that of his flesh and blood body. On
the other hand, it takes longer to learn the rules so as to be able to apply them with ease and security, and even then they cannot be applied so quickly and easily as those attaching to spoken symbols. Moreover, the spoken symbol admits of a hundred quick and subtle adjuncts by way of action, tone and expression, so that no one will use written symbols unless either for the special advantages of permanence and travelling power, or because he is incapacitated from using spoken ones. This, however, is hardly to the point; the point is that these two conventional combinations of symbols, that are as unlike one another as the Hallelujah Chorus is to St. Paul's Cathedral, are the one as much language as the other; and we therefore inquire what this very patent fact reveals to us about the more essential characteristics of language itself. What is the common bond that unites these two classes of symbols that seem at first sight to have nothing in common, and makes the one raise the idea of language in our minds as readily as the other? The bond lies in the fact that both are a set of conventional tokens
Essays on Life

or symbols, agreed upon between the parties to whom they appeal as being attached invariably to the same ideas, and because they are being made as a means of communion between one mind and another,—for a memorandum made for a person's own later use is nothing but a communication from an earlier mind to a later and modified one; it is therefore in reality a communication from one mind to another as much as though it had been addressed to another person.

We see, therefore, that the nature of the outward and visible sign to which the inward and spiritual idea of language is attached does not matter. It may be the firing of a gun; it may be an old semaphore telegraph; it may be the movements of a needle; a look, a gesture, the breaking of a twig by an Indian to tell some one that he has passed that way: a twig broken designedly with this end in view is a letter addressed to whomsoever it may concern, as much as though it had been written out in full on bark or paper. It does not matter one straw what it is, provided it is agreed upon in concert, and stuck to. Just
as the lowest forms of life nevertheless present us with all the essential characteristics of livingness, and are as much alive in their own humble way as the most highly developed organisms, so the rudest intentional and effectual communication between two minds through the instrumentality of a concerted symbol is as much language as the most finished oratory of Mr. Gladstone. I demur therefore to the assertion that the lower animals have no language, inasmuch as they cannot themselves articulate a grammatical sentence. I do not indeed pretend that when the cat calls upon the tiles it uses what it consciously and introspectively recognises as language; it says what it has to say without introspection, and in the ordinary course of business, as one of the common forms of courtship. It no more knows that it has been using language than M. Jourdain knew he had been speaking prose, but M. Jourdain's knowing or not knowing was neither here nor there.

Anything which can be made to hitch on invariably to a definite idea that can carry some distance—say an inch at the least, and
which can be repeated at pleasure, can be pressed into the service of language. Mrs. Bentley, wife of the famous Dr. Bentley of Trinity College, Cambridge, used to send her snuff-box to the college buttery when she wanted beer, instead of a written order. If the snuff-box came the beer was sent, but if there was no snuff-box there was no beer. Wherein did the snuff-box differ more from a written order, than a written order differs from a spoken one? The snuff-box was for the time being language. It sounds strange to say that one might take a pinch of snuff out of a sentence, but if the servant had helped him or herself to a pinch while carrying it to the buttery this is what would have been done; for if a snuff-box can say "Send me a quart of beer," so efficiently that the beer is sent, it is impossible to say that it is not a *bonâ fide* sentence. As for the recipient of the message, the butler did not probably translate the snuff-box into articulate nouns and verbs; as soon as he saw it he just went down into the cellar and drew the beer, and if he thought at all, it was probably about some-
Art and Science

thing else. Yet he must have been thinking without words, or he would have drawn too much beer or too little, or have spilt it in the bringing it up, and we may be sure that he did none of these things.

You will, of course, observe that if Mrs. Bentley had sent the snuff-box to the buttery of St. John's College instead of Trinity, it would not have been language, for there would have been no covenant between sayer and sayee as to what the symbol should represent, there would have been no previously established association of ideas in the mind of the butler of St. John's between beer and snuff-box; the connection was artificial, arbitrary, and by no means one of those in respect of which an impromptu bargain might be proposed by the very symbol itself, and assented to without previous formality by the person to whom it was presented. More briefly, the butler of St. John's would not have been able to understand and read it aright. It would have been a dead letter to him—a snuff-box and not a letter; whereas to the butler of Trinity it was a letter and not a snuff-box.
You will also note that it was only at the moment when he was looking at it and accepting it as a message that it flashed forth from snuff-box-hood into the light and life of living utterance. As soon as it had kindled the butler into sending a single quart of beer, its force was spent until Mrs. Bentley threw her soul into it again and charged it anew by wanting more beer, and sending it down accordingly.

Again, take the ring which the Earl of Essex sent to Queen Elizabeth, but which the queen did not receive. This was intended as a sentence, but failed to become effectual language because the sensible material symbol never reached those sentient organs which it was intended to affect. A book, again, however full of excellent words it may be, is not language when it is merely standing on a bookshelf. It speaks to no one, unless when being actually read, or quoted from by an act of memory. It is potential language as a lucifer-match is potential fire, but it is no more language till it is in contact with a recipient mind, than a
Art and Science

match is fire till it is struck, and is being consumed.

A piece of music, again, without any words at all, or a song with words that have nothing in the world to do with the ideas which it is nevertheless made to convey, is often very effectual language. Much lying, and all irony depends on tampering with covenanted symbols, and making those that are usually associated with one set of ideas convey by a sleight of mind others of a different nature. That is why irony is intolerably fatiguing unless very sparingly used. Take the song which Blondel sang under the window of King Richard's prison. There was not one syllable in it to say that Blondel was there, and was going to help the king to get out of prison. It was about some silly love affair, but it was a letter all the same, and the king made language of what would otherwise have been no language, by guessing the meaning, that is to say by perceiving that he was expected to enter then and there into a new covenant as to the meaning of the symbols that were presented to him, understanding what
this covenant was to be, and acquiescing in it.

On the other hand, no ingenuity can torture language into being a fit word to use in connection with either sounds or any other symbols that have not been intended to convey a meaning, or again in connection with either sounds or symbols in respect of which there has been no covenant between sayer and sayee. When we hear people speaking a foreign language—we will say Welsh—we feel that though they are no doubt using what is very good language as between themselves, there is no language whatever as far as we are concerned. We call it lingo, not language. The Chinese letters on a tea-chest might as well not be there, for all that they say to us, though the Chinese find them very much to the purpose. They are a covenant to which we have been no parties—to which our intelligence has affixed no signature.

We have already seen that it is in virtue of such an understood covenant that symbols so unlike one another as the written word "stone" and the spoken word alike at once
Art and Science

raise the idea of a stone in our minds. See how the same holds good as regards the different languages that pass current in different nations. The letters p, i, e, r, r, e convey the idea of a stone to a Frenchman as readily as s, t, o, n, e do to ourselves. And why? because that is the covenant that has been struck between those who speak and those who are spoken to. Our "stone" conveys no idea to a Frenchman, nor his "pierre" to us, unless we have done what is commonly called acquiring one another's language. To acquire a foreign language is only to learn and adhere to the covenants in respect of symbols which the nation in question has adopted and adheres to. Till we have done this we neither of us know the rules, so to speak, of the game that the other is playing, and cannot, therefore, play together; but the convention being once known and assented to, it does not matter whether we raise the idea of a stone by the word "lapis," or by "lithos," "pietra," "pierre," "stein," "stane" or "stone"; we may choose what symbols written or spoken we choose, and one set, unless they are of unwieldy length.
Essays on Life

will do as well as another, if we can get other people to choose the same and stick to them; it is the accepting and sticking to them that matters, not the symbols. The whole power of spoken language is vested in the invariableness with which certain symbols are associated with certain ideas. If we are strict in always connecting the same symbols with the same ideas, we speak well, keep our meaning clear to ourselves, and convey it readily and accurately to any one who is also fairly strict. If, on the other hand, we use the same combination of symbols for one thing one day and for another the next, we abuse our symbols instead of using them, and those who indulge in slovenly habits in this respect ere long lose the power alike of thinking and of expressing themselves correctly. The symbols, however, in the first instance, may be anything in the wide world that we have a fancy for. They have no more to do with the ideas they serve to convey than money has with the things that it serves to buy.

The principle of association, as every one knows, involves that whenever two things
Art and Science

have been associated sufficiently together, the suggestion of one of them to the mind shall immediately raise a suggestion of the other. It is in virtue of this principle that language, as we so call it, exists at all, for the essence of language consists, as I have said perhaps already too often, in the fixity with which certain ideas are invariably connected with certain symbols. But this being so, it is hard to see how we can deny that the lower animals possess the germs of a highly rude and unspecialised, but still true language, unless we also deny that they have any ideas at all; and this I gather is what Professor Max Müller in a quiet way rather wishes to do. Thus he says, "It is easy enough to show that animals communicate, but this is a fact which has never been doubted. Dogs who growl and bark leave no doubt in the minds of other dogs or cats, or even of man, of what they mean, but growling and barking are not language, nor do they even contain the elements of language."¹

I observe the Professor says that animals

communicate without saying what it is that they communicate. I believe this to have been because if he said that the lower animals communicate their ideas, this would be to admit that they have ideas; if so, and if, as they present every appearance of doing, they can remember, reflect upon, modify these ideas according to modified surroundings, and interchange them with one another, how is it possible to deny them the germs of thought, language, and reason—not to say a good deal more than the germs? It seems to me that not knowing what else to say that animals communicated if it was not ideas, and not knowing what mess he might not get into if he admitted that they had ideas at all, he thought it safer to omit his accusative case altogether.

That growling and barking cannot be called a very highly specialised language goes without saying; they are, however, so much diversified in character, according to circumstances, that they place a considerable number of symbols at an animal's command, and he invariably attaches the same symbol to the
same idea. A cat never purrs when she is angry, nor spits when she is pleased. When she rubs her head against any one affectionately it is her symbol for saying that she is very fond of him, and she expects, and usually finds that it will be understood. If she sees her mistress raise her hand as though to pretend to strike her, she knows that it is the symbol her mistress invariably attaches to the idea of sending her away, and as such she accepts it. Granted that the symbols in use among the lower animals are fewer and less highly differentiated than in the case of any known human language, and therefore that animal language is incomparably less subtle and less capable of expressing delicate shades of meaning than our own, these differences are nevertheless only those that exist between highly developed and inchoate language; they do not involve those that distinguish language from no language. They are the differences between the undifferentiated protoplasm of the amoeba and our own complex organisation; they are not the differences between life and no life. In animal language as much as in
human there is a mind intentionally making use of a symbol accepted by another mind as invariably attached to a certain idea, in order to produce that idea in the mind which it is desired to affect—more briefly, there is a sayer, a sayee, and a covenanted symbol designedly applied. Our own speech is vertebrated and articulated by means of nouns, verbs, and the rules of grammar. A dog’s speech is invertebrate, but I do not see how it is possible to deny that it possesses all the essential elements of language.

I have said nothing about Professor R. L. Garner’s researches into the language of apes, because they have not yet been so far verified and accepted as to make it safe to rely upon them; but when he lays it down that all voluntary sounds are the products of thought, and that, if they convey a meaning to another, they perform the functions of human speech, he says what I believe will commend itself to any unsophisticated mind. I could have wished, however, that he had not limited himself to sounds, and should have preferred his saying what I doubt not he would readily
accept— I mean, that all symbols or tokens of whatever kind, if voluntarily adopted as such, are the products of thought, and perform the functions of human speech; but I cannot too often remind you that nothing can be considered as fulfilling the conditions of language, except a voluntary application of a recognised token in order to convey a more or less definite meaning, with the intention doubtless of thus purchasing as it were some other desired meaning and consequent sensation. It is astonishing how closely in this respect money and words resemble one another. Money indeed may be considered as the most universal and expressive of all languages. For gold and silver coins are no more money when not in the actual process of being voluntarily used in purchase, than words not so in use are language. Pounds, shillings and pence are recognised covenanted tokens, the outward and visible signs of an inward and spiritual purchasing power, but till in actual use they are only potential money, as the symbols of language, whatever they may be, are only potential language till they are passing be-
Essays on Life
tween two minds. It is the power and will to apply the symbols that alone gives life to money, and as long as these are in abeyance the money is in abeyance also; the coins may be safe in one’s pocket, but they are as dead as a log till they begin to burn in it, and so are our words till they begin to burn within us.

The real question, however, as to the substantial underlying identity between the language of the lower animals and our own, turns upon that other question whether or no, in spite of an immeasurable difference of degree, the thought and reason of man and of the lower animals is essentially the same. No one will expect a dog to master and express the varied ideas that are incessantly arising in connection with human affairs. He is a pauper as against a millionaire. To ask him to do so would be like giving a street-boy sixpence and telling him to go and buy himself a founder’s share in the New River Company. He would not even know what was meant, and even if he did it would take several millions of sixpences to buy one. It is astonishing what a clever workman will do with very modest
Art and Science

tools, or again how far a thrifty housewife will make a very small sum of money go, or again in like manner how many ideas an intelligent brute can receive and convey with its very limited vocabulary; but no one will pretend that a dog's intelligence can ever reach the level of a man's. What we do maintain is that, within its own limited range, it is of the same essential character as our own, and that though a dog's ideas in respect of human affairs are both vague and narrow, yet in respect of canine affairs they are precise enough and extensive enough to deserve no other name than thought or reason. We hold moreover that they communicate their ideas in essentially the same manner as we do—that is to say, by the instrumentality of a code of symbols attached to certain states of mind and material objects, in the first instance arbitrarily, but so persistently, that the presentation of the symbol immediately carries with it the idea which it is intended to convey. Animals can thus receive and impart ideas on all that most concerns them. As my great namesake said some two hundred years ago, they know
Editors on Life

"what's what, and that's as high as metaphysic wit can fly." And they not only know what's what themselves, but can impart to one another any new what's-whatness that they may have acquired, for they are notoriously able to instruct and correct one another.

Against this Professor Max Müller contends that we can know nothing of what goes on in the mind of any lower animal, inasmuch as we are not lower animals ourselves. "We can imagine anything we like about what passes in the mind of an animal," he writes, "we can know absolutely nothing."¹ It is something to have it in evidence that he conceives animals as having a mind at all, but it is not easy to see how they can be supposed to have a mind, without being able to acquire ideas, and having acquired, to read, mark, learn, and inwardly digest them. Surely the mistake of requiring too much evidence is hardly less great than that of being contented with too little. We, too, are animals, and can no more refuse to infer reason from certain

visible actions in their case than we can in our own. If Professor Max Müller's plea were allowed, we should have to deny our right to infer confidently what passes in the mind of any one not ourselves, inasmuch as we are not that person. We never, indeed, can obtain irrefragable certainty about this or any other matter, but we can be sure enough in many cases to warrant our staking all that is most precious to us on the soundness of our opinion. Moreover, if the Professor denies our right to infer that animals reason, on the ground that we are not animals enough ourselves to be able to form an opinion, with what right does he infer so confidently himself that they do not reason? And how, if they present every one of those appearances which we are accustomed to connect with the communication of an idea from one mind to another, can we deny that they have a language of their own, though it is one which in most cases we can neither speak nor understand? How can we say that a sentinel rook, when it sees a man with a gun and warns the other rooks by a concerted note which they all show that
they understand by immediately taking flight, should not be credited both with reason and the germs of language?

After all, a professor, whether of philology, psychology, biology, or any other ology, is hardly the kind of person to whom we should appeal on such an elementary question as that of animal intelligence and language. We might as well ask a botanist to tell us whether grass grows, or a meteorologist to tell us if it has left off raining. If it is necessary to appeal to any one, I should prefer the opinion of an intelligent gamekeeper to that of any professor, however learned. The keepers, again, at the Zoological Gardens, have exceptional opportunities for studying the minds of animals—modified, indeed, by captivity, but still minds of animals. Grooms, again, and dog-fanciers, are to the full as able to form an intelligent opinion on the reason and language of animals as any University Professor, and so are cats'-meat men. I have repeatedly asked gamekeepers and keepers at the Zoological Gardens whether animals could reason and converse with one another, and have always
found myself regarded somewhat contemptuously for having even asked the question. I once said to a friend, in the hearing of a keeper at the Zoological Gardens, that the penguin was very stupid. The man was furious, and jumped upon me at once. "He's not stupid at all," said he; "he's very intelligent."

Who has not seen a cat, when it wishes to go out, raise its fore paws on to the handle of the door, or as near as it can get, and look round, evidently asking some one to turn it for her? Is it reasonable to deny that a reasoning process is going on in the cat's mind, whereby she connects her wish with the steps necessary for its fulfilment, and also with certain invariable symbols which she knows her master or mistress will interpret? Once, in company with a friend, I watched a cat playing with a house-fly in the window of a ground-floor room. We were in the street, while the cat was inside. When we came up to the window she gave us one searching look, and, having satisfied herself that we had nothing for her, went on with her
game. She knew all about the glass in the window, and was sure we could do nothing to molest her, so she treated us with absolute contempt, never even looking at us again.

The game was this. She was to catch the fly and roll it round and round under her paw along the window-sill, but so gently as not to injure it nor prevent it from being able to fly again when she had done rolling it. It was very early spring, and flies were scarce, in fact there was not another in the whole window. She knew that if she crippled this one, it would not be able to amuse her further, and that she would not readily get another instead, and she liked the feel of it under her paw. It was soft and living, and the quivering of its wings tickled the ball of her foot in a manner that she found particularly grateful; so she rolled it gently along the whole length of the window-sill. It then became the fly's turn. He was to get up and fly about in the window, so as to recover himself a little; then she was to catch him again, and roll him softly all along the window-sill, as she had done before.

It was plain that the cat knew the rules of
Art and Science

her game perfectly well, and enjoyed it keenly. It was equally plain that the fly could not make head or tail of what it was all about. If it had been able to do so it would have gone to play in the upper part of the window, where the cat could not reach it. Perhaps it was always hoping to get through the glass, and escape that way; anyhow, it kept pretty much to the same pane, no matter how often it was rolled. At last, however, the fly, for some reason or another, did not reappear on the pane, and the cat began looking everywhere to find it. Her annoyance when she failed to do so was extreme. It was not only that she had lost her fly, but that she could not conceive how she should have ever come to do so. Presently she noted a small knot in the woodwork of the sill, and it flashed upon her that she had accidentally killed the fly, and that this was its dead body. She tried to move it gently with her paw, but it was no use, and for the time she satisfied herself that the knot and the fly had nothing to do with one another. Every now and then, however, she returned to it as though it were the only
thing she could think of, and she would try it again. She seemed to say she was certain there had been no knot there before—she must have seen it if there had been; and yet, the fly could hardly have got jammed so firmly into the wood. She was puzzled and irritated beyond measure, and kept looking in the same place again and again, just as we do when we have mislaid something. She was rapidly losing temper and dignity when suddenly we saw the fly reappear from under the cat's stomach and make for the window-pane, at the very moment when the cat herself was exclaiming for the fiftieth time that she wondered where that stupid fly ever could have got to. No man who has been hunting twenty minutes for his spectacles could be more delighted when he suddenly finds them on his own forehead. "So that's where you were," we seemed to hear her say, as she proceeded to catch it, and again began rolling it very softly without hurting it, under her paw.

My friend and I both noticed that the cat, in spite of her perplexity, never so much as hinted that we were the culprits. The question
whether anything outside the window could do her good or harm had long since been settled by her in the negative, and she was not going to reopen it; she simply cut us dead, and though her annoyance was so great that she was manifestly ready to lay the blame on anybody or anything with or without reason, and though she must have perfectly well known that we were watching the whole affair with amusement, she never either asked us if we had happened to see such a thing as a fly go down our way lately, or accused us of having taken it from her—both of which ideas she would, I am confident, have been very well able to convey to us if she had been so minded.

Now what are thought and reason if the processes that were going through this cat's mind were not both one and the other? It would be childish to suppose that the cat thought in words of its own, or in anything like words. Its thinking was probably conducted through the instrumentality of a series of mental images. We so habitually think in words ourselves that we find it difficult to realise
thought without words at all; our difficulty, however, in imagining the particular manner in which the cat thinks has nothing to do with the matter. We must answer the question whether she thinks or no, not according to our own ease or difficulty in understanding the particular manner of her thinking, but according as her action does or does not appear to be of the same character as other action that we commonly call thoughtful. To say that the cat is not intelligent, merely on the ground that we cannot ourselves fathom her intelligence—this, as I have elsewhere said, is to make intelligence mean the power of being understood, rather than the power of understanding. This nevertheless is what, for all our boasted intelligence, we generally do. The more we can understand an animal's ways, the more intelligent we call it, and the less we can understand these, the more stupid do we declare it to be. As for plants—whose punctuality and attention to all the details and routine of their somewhat restricted lines of business is as obvious as it is beyond all praise—we understand the work-
ing of their minds so little that by common consent we declare them to have no intelligence at all.

Before concluding I should wish to deal a little more fully with Professor Max Müller's contention that there can be no reason without language, and no language without reason. Surely when two practised pugilists are fighting, parrying each other's blows, and watching keenly for an unguarded point, they are thinking and reasoning very subtly the whole time, without doing so in words. The machination of their thoughts, as well as its expression, is actual—I mean, effectuated and expressed by action and deed, not words. They are unaware of any logical sequence of thought that they could follow in words as passing through their minds at all. They may perhaps think consciously in words now and again, but such thought will be intermittent, and the main part of the fighting will be done without any internal concomitance of articulated phrases. Yet we cannot doubt that their action, however much we may disapprove of it, is guided by intelligence and reason; nor should we
doubt that a reasoning process of the same character goes on in the minds of two dogs or fighting-cocks when they are striving to master their opponents.

Do we think in words, again, when we wind up our watches, put on our clothes, or eat our breakfasts? If we do, it is generally about something else. We do these things almost as much without the help of words as we wink or yawn, or perform any of those other actions that we call reflex, as it would almost seem because they are done without reflection. They are not, however, the less reasonable because wordless.

Even when we think we are thinking in words, we do so only in half measure. A running accompaniment of words no doubt frequently attends our thoughts; but, unless we are writing or speaking, this accompaniment is of the vaguest and most fitful kind, as we often find out when we try to write down or say what we are thinking about, though we have a fairly definite notion of it, or fancy that we have one, all the time. The thought is not steadily and coherently
Art and Science

governed by and moulded in words, nor does it steadily govern them. Words and thought interact upon and help one another, as any other mechanical appliances interact on and help the invention that first hit upon them; but reason or thought, for the most part, flies along over the heads of words, working its own mysterious way in paths that are beyond our ken, though whether some of our departmental personalities are as unconscious of what is passing, as that central government is which we alone dub with the name of "we" or "us," is a point on which I will not now touch.

I cannot think, then, that Professor Max Müller's contention that thought and language are identical—and he has repeatedly affirmed this—will ever be generally accepted. Thought is no more identical with language than feeling is identical with the nervous system. True, we can no more feel without a nervous system than we can discern certain minute organisms without a microscope. Destroy the nervous system, and we destroy feeling. Destroy the microscope, and we can
no longer see the animalcules; but our sight of the animalcules is not the microscope, though it is effectuated by means of the microscope, and our feeling is not the nervous system, though the nervous system is the instrument that enables us to feel.

The nervous system is a device which living beings have gradually perfected—I believe I may say quite truly—through the will and power which they have derived from a fountain-head, the existence of which we can infer, but which we can never apprehend. By the help of this device, and in proportion as they have perfected it, living beings feel ever with greater definiteness, and hence formulate their feelings in thought with more and more precision. The higher evolution of thought has reacted on the nervous system, and the consequent higher evolution of the nervous system has again reacted upon thought. These things are as power and desire, or supply and demand, each one of which is continually outstripping, and being in turn outstripped by the other; but, in spite of their close connection and interaction, power is not desire, nor
Art and Science

demand supply. Language is a device evolved sometimes by leaps and bounds, and sometimes exceedingly slowly, whereby we help ourselves alike to greater ease, precision, and complexity of thought, and also to more convenient interchange of thought among ourselves. Thought found rude expression, which gradually among other forms assumed that of words. These reacted upon thought, and thought again on them, but thought is no more identical with words than words are with the separate letters of which they are composed.

To sum up, then, and to conclude. I would ask you to see the connection between words and ideas, as in the first instance arbitrary. No doubt in some cases an imitation of the cry of some bird or wild beast would suggest the name that should be attached to it; occasionally the sound of an operation such as grinding may have influenced the choice of the letters g, r, as the root of many words that denote a grinding, grating, grasping, crushing, action; but I understand that the number of words due to direct imitation is
comparatively few in number, and that they have been mainly coined as the result of connections so far-fetched and fanciful as to amount practically to no connection at all. Once chosen, however, they were adhered to for a considerable time among the dwellers in any given place, so as to become acknowledged as the vulgar tongue, and raise readily in the mind of the inhabitants of that place the ideas with which they had been artificially associated.

As regards our being able to think and reason without words, the Duke of Argyll has put the matter as soundly as I have yet seen it stated. "It seems to me," he wrote, "quite certain that we can and do constantly think of things without thinking of any sound or word as designating them. Language seems to me to be necessary for the progress of thought, but not at all for the mere act of thinking. It is a product of thought, an expression of it, a vehicle for the communication of it, and an embodiment which is essential to its growth and continuity; but it seems to me altogether erroneous to regard it as an inseparable part of cogitation."
The following passages, again, are quoted from Sir William Hamilton in Professor Max Müller's own book, with so much approval as to lead one to suppose that the differences between himself and his opponents are in reality less than he believes them to be:—

"Language," says Sir W. Hamilton, "is the attribution of signs to our cognitions of things. But as a cognition must have already been there before it could receive a sign, consequently that knowledge which is denoted by the formation and application of a word must have preceded the symbol that denotes it. A sign, however, is necessary to give stability to our intellectual progress—to establish each step in our advance as a new starting-point for our advance to another beyond. A country may be overrun by an armed host, but it is only conquered by the establishment of fortresses. Words are the fortresses of thought. They enable us to realise our dominion over what we have already overrun in thought; to make every intellectual conquest the base of operations for others still beyond."

"This," says Professor Max Müller, "is a
most happy illustration," and he proceeds to quote the following, also from Sir William Hamilton, which he declares to be even happier still.

"You have all heard," says Sir William Hamilton, "of the process of tunnelling through a sandbank. In this operation it is impossible to succeed unless every foot, nay, almost every inch of our progress be secured by an arch of masonry before we attempt the excavation of another. Now language is to the mind precisely what the arch is to the tunnel. The power of thinking and the power of excavation are not dependent on the words in the one case or on the mason-work in the other; but without these subsidaries neither could be carried on beyond its rudimentary commencement. Though, therefore, we allow that every movement forward in language must be determined by an antecedent movement forward in thought, still, unless thought be accompanied at each point of its evolutions by a corresponding evolution of language, its further development is arrested."

Man has evolved an articulate language,
whereas the lower animals seem to be without one. Man, therefore, has far outstripped them in reasoning faculty as well as in power of expression. This, however, does not bar the communications which the lower animals make to one another from possessing all the essential characteristics of language, and as a matter of fact, wherever we can follow them we find such communications effectuated by the aid of arbitrary symbols covenanted upon by the living beings that wish to communicate, and persistently associated with certain corresponding feelings, states of mind, or material objects. Human language is nothing more than this in principle, however much further the principle has been carried in our own case than in that of the lower animals.

This being admitted, we should infer that the thought or reason on which the language of men and animals is alike founded differs as between men and brutes in degree but not in kind. More than this cannot be claimed on behalf of the lower animals, even by their most enthusiastic admirer.
THE DEADLOCK IN DARWINISM

PART I

It will be readily admitted that of all living writers Mr. Alfred Russel Wallace is the one the peculiar turn of whose mind best fits him to write on the subject of natural selection, or the accumulation of fortunate but accidental variations through descent and the struggle for existence. His mind in all its more essential characteristics closely resembles that of the late Mr. Charles Darwin himself, and it is no doubt due to this fact that he and Mr. Darwin elaborated their famous theory at the same time, and independently of one another. I shall have occasion in the course of the following article to show how misled and misleading both these distinguished men have been, in spite of their unquestionable familiarity with the whole range of animal and vegetable

1 Published in the *Universal Review*, April, May, and June 1890.
phenomena. I believe it will be more respectful to both of them to do this in the most outspoken way. I believe their work to have been as mischievous as it has been valuable, and as valuable as it has been mischievous; and higher, whether praise or blame, I know not how to give. Nevertheless I would in the outset, and with the utmost sincerity, admit concerning Messrs. Wallace and Darwin that neither can be held as the more profound and conscientious thinker; neither can be put forward as the more ready to acknowledge obligation to the great writers on evolution who had preceded him, or to place his own developments in closer and more conspicuous historical connection with earlier thought upon the subject; neither is the more ready to welcome criticism and to state his opponent's case in the most pointed and telling way in which it can be put; neither is the more quick to encourage new truth; neither is the more genial, generous adversary, or has the pro-founder horror of anything even approaching literary or scientific want of candour; both display the same inimitable power of putting
their opinions forward in the way that shall best ensure their acceptance; both are equally unrivalled in the tact that tells them when silence will be golden, and when on the other hand a whole volume of facts may be advantageously brought forward. Less than the foregoing tribute both to Messrs. Darwin and Wallace I will not, and more I cannot pay.

Let us now turn to the most authoritative exponent of latter-day evolution—I mean to Mr. Wallace, whose work, entitled "Darwinism," though it should have been entitled "Wallaceism," is still so far Darwinistic that it develops the teaching of Mr. Darwin in the direction given to it by Mr. Darwin himself—so far, indeed, as this can be ascertained at all—and not in that of Lamarck. Mr. Wallace tells us, on the first page of his preface, that he has no intention of dealing even in outline with the vast subject of evolution in general, and has only tried to give such an account of the theory of natural selection as may facilitate a clear conception of Darwin's work. How far he has succeeded is a point on which opinion will probably be
divided. Those who find Mr. Darwin's works clear will also find no difficulty in understanding Mr. Wallace; those, on the other hand, who find Mr. Darwin puzzling are little likely to be less puzzled by Mr. Wallace. He continues:

"The objections now made to Darwin's theory apply solely to the particular means by which the change of species has been brought about, not to the fact of that change."

But "Darwin's theory"—as Mr. Wallace has elsewhere proved that he understands—has no reference "to the fact of that change"—that is to say, to the fact that species have been modified in course of descent from other species. This is no more Mr. Darwin's theory than it is the reader's or my own. Darwin's theory is concerned only with "the particular means by which the change of species has been brought about"; his contention being that this is mainly due to the natural survival of those individuals that have happened by some accident to be born most favourably adapted to their surroundings, or, in other words, through accumulation in the common
course of nature of the more lucky variations that chance occasionally purveys. Mr. Wallace's words, then, in reality amount to this, that the objections now made to Darwin's theory apply solely to Darwin's theory, which is all very well as far as it goes, but might have been more easily apprehended if he had simply said, "There are several objections now made to Mr. Darwin's theory."

It must be remembered that the passage quoted above occurs on the first page of a preface dated March 1889, when the writer had completed his task, and was most fully conversant with his subject. Nevertheless, it seems indisputable either that he is still confusing evolution with Mr. Darwin's theory, or that he does not know when his sentences have point and when they have none.

I should perhaps explain to some readers that Mr. Darwin did not modify the main theory put forward, first by Buffon, to whom it indisputably belongs, and adopted from him by Erasmus Darwin, Lamarck, and many other writers in the latter half of the last century and the earlier years of the present.
The early evolutionists maintained that all existing forms of animal and vegetable life, including man, were derived in course of descent with modification from forms resembling the lowest now known.

Mr. Darwin went as far as this, and farther no one can go. The point at issue between him and his predecessors involves neither the main fact of evolution, nor yet the geometrical ratio of increase, and the struggle for existence consequent thereon. Messrs. Darwin and Wallace have each thrown invaluable light upon these last two points, but Buffon, as early as 1756, had made them the keystone of his system. "The movement of nature," he then wrote, "turns on two immovable pivots: one, the illimitable fecundity which she has given to all species: the other, the innumerable difficulties which reduce the results of that fecundity." Erasmus Darwin and Lamarck followed in the same sense. They thus admit the survival of the fittest as fully as Mr. Darwin himself, though they do not make use of this particular expression. The dispute turns not upon natural selection, which is
common to all writers on evolution, but upon the nature and causes of the variations that are supposed to be selected from and thus accumulated. Are these mainly attributable to the inherited effects of use and disuse, supplemented by occasional sports and happy accidents? Or are they mainly due to sports and happy accidents, supplemented by occasional inherited effects of use and disuse?

The Lamarckian system has all along been maintained by Mr. Herbert Spencer, who, in his "Principles of Biology," published in 1865, showed how impossible it was that accidental variations should accumulate at all. I am not sure how far Mr. Spencer would consent to being called a Lamarckian pure and simple, nor yet how far it is strictly accurate to call him one; nevertheless, I can see no important difference in the main positions taken by him and by Lamarck.

The question at issue between the Lamarckians, supported by Mr. Spencer and a growing band of those who have risen in rebellion against the Charles-Darwinian system on the one hand, and Messrs. Darwin and Wallace
Art and Science

with the greater number of our more prominent biologists on the other, involves the very existence of evolution as a workable theory. For it is plain that what Nature can be supposed able to do by way of choice must depend on the supply of the variations from which she is supposed to choose. She cannot take what is not offered to her; and so again she cannot be supposed able to accumulate unless what is gained in one direction in one generation, or series of generations, is little likely to be lost in those that presently succeed. Now variations ascribed mainly to use and disuse can be supposed capable of being accumulated, for use and disuse are fairly constant for long periods among the individuals of the same species, and often over large areas; moreover, conditions of existence involving changes of habit, and thus of organisation, come for the most part gradually; so that time is given during which the organism can endeavour to adapt itself in the requisite respects, instead of being shocked out of existence by too sudden change. Variations, on the other hand, that are ascribed to mere
chance cannot be supposed as likely to be accumulated, for chance is notoriously inconstant, and would not purvey the variations in sufficiently unbroken succession, or in a sufficient number of individuals, modified similarly in all the necessary correlations at the same time and place to admit of their being accumulated. It is vital therefore to the theory of evolution, as was early pointed out by the late Professor Fleeming Jenkin and by Mr. Herbert Spencer, that variations should be supposed to have a definite and persistent principle underlying them, which shall tend to engender similar and simultaneous modification, however small, in the vast majority of individuals composing any species. The existence of such a principle and its permanence is the only thing that can be supposed capable of acting as rudder and compass to the accumulation of variations, and of making it hold steadily on one course for each species, till eventually many havens, far remote from one another, are safely reached.

It is obvious that the having fatally impaired the theory of his predecessors could
not warrant Mr. Darwin in claiming, as he most fatuously did, the theory of evolution. That he is still generally believed to have been the originator of this theory is due to the fact that he claimed it, and that a powerful literary backing at once came forward to support him. It seems at first sight improbable that those who too zealously urged his claims were unaware that so much had been written on the subject, but when we find even Mr. Wallace himself as profoundly ignorant on this subject as he still either is, or affects to be, there is no limit assignable to the ignorance or affected ignorance of the kind of biologists who would write reviews in leading journals thirty years ago. Mr. Wallace writes:—

"A few great naturalists, struck by the very slight difference between many of these species, and the numerous links that exist between the most different forms of animals and plants, and also observing that a great many species do vary considerably in their forms, colours and habits, conceived the idea that they might be all produced one from the
other. The most eminent of these writers was a great French naturalist, Lamarck, who published an elaborate work, the *Philosophie Zoologique*, in which he endeavoured to prove that all animals whatever are descended from other species of animals. He attributed the change of species chiefly to the effect of changes in the conditions of life—such as climate, food, &c.; and especially to the desires and efforts of the animals themselves to improve their condition, leading to a modification of form or size in certain parts, owing to the well-known physiological law that all organs are strengthened by constant use, while they are weakened or even completely lost by disuse. . . .

"The only other important work dealing with the question was the celebrated 'Vestiges of Creation,' published anonymously, but now acknowledged to have been written by the late Robert Chambers."

None are so blind as those who will not see, and it would be waste of time to argue with the invincible ignorance of one who thinks Lamarck and Buffon conceived that all species
Art and Science

were produced from one another, more especially as I have already dealt at some length with the early evolutionists in my work, "Evolution, Old and New," first published ten years ago, and not, so far as I am aware, detected in serious error or omission. If, however, Mr. Wallace still thinks it safe to presume so far on the ignorance of his readers as to say that the only two important works on evolution before Mr. Darwin's were Lamarck's *Philosophie Zoologique* and the "Vestiges of Creation," how fathomable is the ignorance of the average reviewer likely to have been thirty years ago, when the "Origin of Species" was first published? Mr. Darwin claimed evolution as his own theory. Of course, he would not claim it if he had no right to it. Then by all means give him the credit of it. This was the most natural view to take, and it was generally taken. It was not, moreover, surprising that people failed to appreciate all the niceties of Mr. Darwin's "distinctive feature" which, whether distinctive or no, was assuredly not distinct, and was never frankly contrasted with the older view, as it would have been by
one who wished it to be understood and judged upon its merits. It was in consequence of this omission that people failed to note how fast and loose Mr. Darwin played with his distinctive feature, and how readily he dropped it on occasion.

It may be said that the question of what was thought by the predecessors of Mr. Darwin is, after all, personal, and of no interest to the general public, comparable to that of the main issue—whether we are to accept evolution or not. Granted that Buffon, Erasmus Darwin, and Lamarck bore the burden and heat of the day before Mr. Charles Darwin was born, they did not bring people round to their opinion, whereas Mr. Darwin and Mr. Wallace did, and the public cannot be expected to look beyond this broad and indisputable fact.

The answer to this is, that the theory which Messrs. Darwin and Wallace have persuaded the public to accept is demonstrably false, and that the opponents of evolution are certain in the end to triumph over it. Paley, in his "Natural Theology," long since brought forward far too much evidence of design in animal
organisation to allow of our setting down its marvels to the accumulations of fortunate accident, undirected by will, effort and intelligence. Those who examine the main facts of animal and vegetable organisation without bias will, no doubt, ere long conclude that all animals and vegetables are derived ultimately from unicellular organisms, but they will not less readily perceive that the evolution of species without the concomitance and direction of mind and effort is as inconceivable as is the independent creation of every individual species. The two facts, evolution and design, are equally patent to plain people. There is no escaping from either. According to Messrs. Darwin and Wallace, we may have evolution, but are on no account to have it as mainly due to intelligent effort, guided by ever higher and higher range of sensations, perceptions, and ideas. We are to set it down to the shuffling of cards, or the throwing of dice without the play, and this will never stand.

According to the older men, cards did indeed count for much, but play counted for more. They denied the teleology of the time
—that is to say, the teleology that saw all adaptation to surroundings as part of a plan devised long ages since by a quasi-anthropomorphic being who schemed everything out much as a man would do, but on an infinitely vaster scale. This conception they found repugnant alike to intelligence and conscience, but, though they do not seem to have perceived it, they left the door open for a design more true and more demonstrable than that which they excluded. By making their variations mainly due to effort and intelligence, they made organic development run on all-fours with human progress, and with inventions which we have watched growing up from small beginnings. They made the development of man from the amœba part and parcel of the story that may be read, though on an infinitely smaller scale, in the development of our most powerful marine engines from the common kettle, or of our finest microscopes from the dew-drop.

The development of the steam-engine and the microscope is due to intelligence and design, which did indeed utilise chance sug-
gestions, but which improved on these, and directed each step of their accumulation, though never foreseeing more than a step or two ahead, and often not so much as this. The fact, as I have elsewhere urged, that the man who made the first kettle did not foresee the engines of the *Great Eastern*, or that he who first noted the magnifying power of the dew-drop had no conception of our present microscopes—the very limited amount, in fact, of design and intelligence that was called into play at any one point—this does not make us deny that the steam-engine and microscope owe their development to design. If each step of the road was designed, the whole journey was designed, though the particular end was not designed when the journey was begun. And so is it, according to the older view of evolution, with the development of those living organs, or machines, that are born with us, as part of the perambulating carpenter's chest we call our bodies. The older view gives us our design, and gives us our evolution too. If it refuses to see a quasi-anthropomorphic God modelling each species
Essays on Life

from without as a potter models clay, it gives us God as vivifying and indwelling in all His creatures—He in them, and they in Him. If it refuses to see God outside the universe, it equally refuses to see any part of the universe as outside God. If it makes the universe the body of God, it also makes God the soul of the universe. The question at issue, then, between the Darwinism of Erasmus Darwin and the neo-Darwinism of his grandson, is not a personal one, nor anything like a personal one. It not only involves the existence of evolution, but it affects the view we take of life and things in an endless variety of most interesting and important ways. It is imperative, therefore, on those who take any interest in these matters, to place side by side in the clearest contrast the views of those who refer the evolution of species mainly to accumulation of variations that have no other inception than chance, and of that older school which makes design perceive and develop still further the goods that chance provides.

But over and above this, which would be in
Art and Science

itself sufficient, the historical mode of studying any question is the only one which will enable us to comprehend it effectually. The personal element cannot be eliminated from the consideration of works written by living persons for living persons. We want to know who is who—whom we can depend upon to have no other end than the making things clear to himself and his readers, and whom we should mistrust as having an ulterior aim on which he is more intent than on the furthering of our better understanding. We want to know who is doing his best to help us, and who is only trying to make us help him, or to bolster up the system in which his interests are vested. There is nothing that will throw more light upon these points than the way in which a man behaves towards those who have worked in the same field with himself, and, again, than his style. A man's style, as Buffon long since said, is the man himself. By style, I do not, of course, mean grammar or rhetoric, but that style of which Buffon again said that it is like happiness, and vient de la douceur de l'âme. When we find a
man concealing worse than nullity of meaning under sentences that sound plausibly enough, we should distrust him much as we should a fellow-traveller whom we caught trying to steal our watch. We often cannot judge of the truth or falsehood of facts for ourselves, but we most of us know enough of human nature to be able to tell a good witness from a bad one.

However this may be, and whatever we may think of judging systems by the directness or indirectness of those who advance them, biologists, having committed themselves too rashly, would have been more than human if they had not shown some pique towards those who dared to say, first, that the theory of Messrs. Darwin and Wallace was unworkable; and secondly, that even though it were workable it would not justify either of them in claiming evolution. When biologists show pique at all they generally show a good deal of pique, but pique or no pique, they shunned Mr. Spencer's objection above referred to with a persistency more unanimous and obstinate than I ever remember to have seen displayed.
Art and Science

even by professional truth-seekers. I find no rejoinder to it from Mr. Darwin himself, between 1865 when it was first put forward, and 1882 when Mr. Darwin died. It has been similarly "ostrichised" by all the leading apologists of Darwinism, so far at least as I have been able to observe, and I have followed the matter closely for many years. Mr. Spencer has repeated and amplified it in his recent work, "The Factors of Organic Evolution," but it still remains without so much as an attempt at serious answer, for the perfunctory and illusory remarks of Mr. Wallace at the end of his "Darwinism" cannot be counted as such. The best proof of its irresistible weight is that Mr. Darwin, though maintaining silence in respect to it, retreated from his original position in the direction that would most obviate Mr. Spencer's objection.

Yet this objection has been repeatedly urged by the more prominent anti-Charles-Darwinian authorities, and there is no sign that the British public is becoming less rigorous in requiring people either to reply to objections repeatedly urged by men of
even moderate weight, or to let judgment go by default. As regards Mr. Darwin's claim to the theory of evolution generally, Darwinians are beginning now to perceive that this cannot be admitted, and either say with some hardihood that Mr. Darwin never claimed it, or after a few saving clauses to the effect that this theory refers only to the particular means by which evolution has been brought about, imply forthwith thereafter none the less that evolution is Mr. Darwin's theory. Mr. Wallace has done this repeatedly in his recent "Darwinism." Indeed, I should be by no means sure that on the first page of his preface, in the passage about "Darwin's theory," which I have already somewhat severely criticised, he was not intending evolution by "Darwin's theory," if in his preceding paragraph he had not so clearly shown that he knew evolution to be a theory of greatly older date than Mr. Darwin's.

The history of science—well exemplified by that of the development theory—is the history of eminent men who have fought against light and have been worsted. The
tenacity with which Darwinians stick to their accumulation of fortuitous variations is on a par with the like tenacity shown by the illustrious Cuvier, who did his best to crush evolution altogether. It always has been thus, and always will be; nor is it desirable in the interests of Truth herself that it should be otherwise. Truth is like money—lightly come, lightly go; and if she cannot hold her own against even gross misrepresentation, she is herself not worth holding. Misrepresentation in the long run makes Truth as much as it mars her; hence our law courts do not think it desirable that pleaders should speak their bonâ fide opinions, much less that they should profess to do so. Rather let each side hoodwink judge and jury as best it can, and let truth flash out from collision of defence and accusation. When either side will not collide, it is an axiom of controversy that it desires to prevent the truth from being elicited.

Let us now note the courses forced upon biologists by the difficulties of Mr. Darwin's distinctive feature. Mr. Darwin and Mr.
Essays on Life

Wallace, as is well known, brought the feature forward simultaneously and independently of one another, but Mr. Wallace always believed in it more firmly than Mr. Darwin did. Mr. Darwin as a young man did not believe in it. He wrote before 1839, "Nature, by making habit omnipotent and its effects hereditary, has fitted the Fuegian for the climate and productions of his country,"¹ a sentence than which nothing can coincide more fully with the older view that use and disuse were the main purveyors of variations, or conflict more fatally with his own subsequent distinctive feature. Moreover, as I showed in my last work on evolution,² in the peroration to his "Origin of Species," he discarded his accidental variations altogether, and fell back on the older theory, so that the body of the "Origin of Species" supports one theory, and the peroration another that differs from it toto cælo. Finally, in his later editions, he retreated indefinitely from his original posi-

¹ "Voyages of the Adventure and Beagle," iii. p. 237.
² "Luck, or Cunning, as the main means of Organic Modification?" (Longmans), pp. 179, 180.
tion, edging always more and more continually towards the theory of his grandfather and Lamarck. These facts convince me that he was at no time a thorough-going Darwinian, but was throughout an unconscious Lamarckian, though ever anxious to conceal the fact alike from himself and from his readers.

Not so with Mr. Wallace, who was both more outspoken in the first instance, and who has persevered along the path of Wallaceism just as Mr. Darwin with greater sagacity was ever on the retreat from Darwinism. Mr. Wallace's profounder faith led him in the outset to place his theory in fuller daylight than Mr. Darwin was inclined to do. Mr. Darwin just waved Lamarck aside, and said as little about him as he could, while in his earlier editions Erasmus Darwin and Buffon were not so much as named. Mr. Wallace, on the contrary, at once raised the Lamarckian spectre, and declared it exorcised. He said the Lamarckian hypothesis was "quite unnecessary." The giraffe did not "acquire its long neck by desiring to reach the foliage of
the more lofty shrubs, and constantly stretching its neck for this purpose, but because any varieties which occurred among its antitypes with a longer neck than usual at once secured a fresh range of pasture over the same ground as their shorter-necked companions, and on the first scarcity of food were thus enabled to outlive them."

"Which occurred" is evidently "which happened to occur" by some chance or accident unconnected with use and disuse. The word "accident" is never used, but Mr. Wallace must be credited with this instance of a desire to give his readers a chance of perceiving that according to his distinctive feature evolution is an affair of luck, rather than of cunning. Whether his readers actually did understand this as clearly as Mr. Wallace doubtless desired that they should, and whether greater development at this point would not have helped them to fuller apprehension, we need not now inquire. What was gained in distinctness might have been

lost in distinctiveness, and after all he did technically put us upon our guard.

Nevertheless he too at a pinch takes refuge in Lamarckism. In relation to the manner in which the eyes of soles, turbots, and other flat-fish travel round the head so as to become in the end unsymmetrically placed, he says:—

"The eyes of these fish are curiously distorted in order that both eyes may be upon the upper side, where alone they would be of any use. . . . Now if we suppose this process, which in the young is completed in a few days or weeks, to have been spread over thousands of generations during the development of these fish, those usually surviving whose eyes retained more and more of the position into which the young fish tried to twist them [italics mine], the change becomes intelligible."¹ When it was said by Professor Ray Lankester—who knows as well as most people what Lamarck taught—that this was "flat Lamarckism," Mr. Wallace rejoined that it was the survival of the modified individuals that did it all, not the efforts of the young fish to twist their

¹ "Darwinism" (Macmillan, 1889), p. 129.
eyes, and the transmission to descendants of the effects of those efforts. But this, as I said in my book, "Evolution, Old and New," is like saying that horses are swift runners, not by reason of the causes, whatever they were, that occasioned the direct line of their progenitors to vary towards ever greater and greater swiftness, but because their more slow-going uncles and aunts go away. Plain people will prefer to say that the main cause of any accumulation of favourable modifications consists rather in that which brings about the initial variations, and in the fact that these can be inherited at all, than in the fact that the unmodified individuals were not successful. People do not become rich because the poor in large numbers go away, but because they have been lucky, or provident, or more commonly both. If they would keep their wealth when they have made it they must exclude luck thenceforth to the utmost of their power, and their children must follow their example, or they will soon lose their money. The fact that the weaker go to the

---

1 Longmans, 1890, p. 376.
Art and Science

wall does not bring about the greater strength of the stronger; it is the consequence of this last and not the cause—unless, indeed, it be contended that a knowledge that the weak go to the wall stimulates the strong to exertions which they would not otherwise so make, and that these exertions produce inheritable modifications. Even in this case, however, it would be the exertions, or use and disuse, that would be the main agents in the modification. But it is not often that Mr. Wallace thus backslides. His present position is that acquired (as distinguished from congenital) modifications are not inherited at all. He does not indeed put his faith prominently forward and pin himself to it as plainly as could be wished, but under the heading, "The Non-Heredity of Acquired Characters," he writes as follows on p. 440 of his recent work in reference to Professor Weismann’s Theory of Heredity:

"Certain observations on the embryology of the lower animals are held to afford direct proof of this theory of heredity, but they are too technical to be made clear to ordinary readers. A logical result of the theory is the
impossibility of the transmission of acquired characters, since the molecular structure of the germ-plasm is already determined within the embryo; and Weismann holds that there are no facts which really prove that acquired characters can be inherited, although their inheritance has, by most writers, been considered so probable as hardly to stand in need of direct proof.

"We have already seen in the earlier part of this chapter that many instances of change, imputed to the inheritance of acquired variations, are really cases of selection."

And the rest of the remarks tend to convey the impression that Mr. Wallace adopts Professor Weismann's view, but, curiously enough, though I have gone through Mr. Wallace's book with a special view to this particular point, I have not been able to find him definitely committing himself either to the assertion that acquired modifications never are inherited, or that they sometimes are so. It is abundantly laid down that Mr. Darwin laid too much stress on use and disuse, and a residuary impression is left that Mr. Wallace
Art and Science

is endorsing Professor Weismann's view, but I have found it impossible to collect anything that enables me to define his position confidently in this respect.

This is natural enough, for Mr. Wallace has entitled his book "Darwinism," and a work denying that use and disuse produced any effect could not conceivably be called Darwinism. Mr. Herbert Spencer has recently collected many passages from "The Origin of Species" and from "Animals and Plants under Domestication,"¹ which show how largely, after all, use and disuse entered into Mr. Darwin's system, and we know that in his later years he attached still more importance to them. It was out of the question, therefore, that Mr. Wallace should categorically deny that their effects were inheritable. On the other hand, the temptation to adopt Professor Weismann's view must have been overwhelming to one who had been already inclined to minimise the effects of use and disuse. On the whole, one does not see what Mr. Wallace could do, other than what he has done—unless, of course,

¹ See Nature, March 6, 1890.
he changed his title, or had been no longer Mr. Wallace.

Besides, thanks to the works of Mr. Spencer, Professor Mivart, Professor Semper, and very many others, there has for some time been a growing perception that the Darwinism of Charles Darwin was doomed. Use and disuse must either do even more than is officially recognised in Mr. Darwin's later concessions, or they must do a great deal less. If they can do as much as Mr. Darwin himself said they did, why should they not do more? Why stop where Mr. Darwin did? And again, where in the name of all that is reasonable did he really stop? He drew no line, and on what principle can we say that so much is possible as effect of use and disuse, but so much more impossible? If, as Mr. Darwin contended, disuse can so far reduce an organ as to render it rudimentary, and in many cases get rid of it altogether, why cannot use create as much as disuse can destroy, provided it has anything, no matter how low in structure, to begin with? Let us know where we stand. If it is admitted that use and disuse can do a good
Art and Science

deal, what does a good deal mean? And what is the proportion between the shares attributable to use and disuse and to natural selection respectively? If we cannot be told with absolute precision, let us at any rate have something more definite than the statement that natural selection is "the most important means of modification."

Mr. Darwin gave us no help in this respect; and worse than this, he contradicted himself so flatly as to show that he had very little definite idea upon the subject at all. Thus in respect to the winglessness of the Madeira beetles he wrote:

"In some cases we might easily put down to disuse modifications of structure, which are wholly or mainly due to natural selection. Mr. Wollaston has discovered the remarkable fact that 200 beetles, out of the 550 species (but more are now known) inhabiting Madeira, are so far deficient in wings that they cannot fly; and that of the 29 endemic genera no less than 23 have all their species in this condition! Several facts,—namely, that beetles in many parts of the world are frequently blown out to
sea and perish; that the beetles in Madeira, as observed by Mr. Wollaston, lie much concealed until the wind lulls and the sun shines; that the proportion of wingless beetles is larger on the exposed Desertas than in Madeira itself; and especially the extraordinary fact, so strongly insisted on by Mr. Wollaston, that certain large groups of beetles, elsewhere excessively numerous, which absolutely require the use of their wings are here almost entirely absent;—these several considerations make me believe that the wingless condition of so many Madeira beetles is mainly due to the action of natural selection, combined probably with disuse [italics mine]. For during many successive generations each individual beetle which flew least, either from its wings having been ever so little less perfectly developed or from indolent habit, will have had the best chance of surviving, from not being blown out to sea; and, on the other hand, those beetles which most readily took to flight would oftenest have been blown to sea, and thus destroyed.”

We should like to know, first, somewhere about how much disuse was able to do after all, and moreover why, if it can do anything at all, it should not be able to do all. Mr. Darwin says: "Any change in structure and function which can be effected by small stages is within the power of natural selection."

"And why not," we ask, "within the power of use and disuse?" Moreover, on a later page we find Mr. Darwin saying:—

"It appears probable that disuse has been the main agent in rendering organs rudimentary [italics mine]. It would at first lead by slow steps to the more and more complete reduction of a part, until at last it has become rudimentary—as in the case of the eyes of animals inhabiting dark caverns, and of the wings of birds inhabiting oceanic islands, which have seldom been forced by beasts of prey to take flight, and have ultimately lost the power of flying. Again, an organ, useful under certain conditions, might become injurious under others, as with the wings of beetles living on small and exposed islands; and in this case natural selection will have aided in reducing the organ,
Essays on Life

until it was rendered harmless and rudimentary [italics mine].”¹

So that just as an undefined amount of use and disuse was introduced on the earlier page to supplement the effects of natural selection in respect of the wings of beetles on small and exposed islands, we have here an undefined amount of natural selection introduced to supplement the effects of use and disuse in respect of the identical phenomena. In the one passage we find that natural selection has been the main agent in reducing the wings, though use and disuse have had an appreciable share in the result; in the other, it is use and disuse that have been the main agents, though an appreciable share in the result must be ascribed to natural selection.

Besides, who has seen the uncles and aunts going away with the uniformity that is necessary for Mr. Darwin's contention? We know that birds and insects do often get blown out to sea and perish, but in order to establish Mr. Darwin's position we want the evidence of those who watched the reduction of the

wings during the many generations in the course of which it was being effected, and who can testify that all, or the overwhelming majority, of the beetles born with fairly well-developed wings got blown out to sea, while those alone survived whose wings were congenitally degenerate. Who saw them go, or can point to analogous cases so conclusive as to compel assent from any equitable thinker?

Darwinians of the stamp of Mr. Thiselton Dyer, Professor Ray Lankester, or Mr. Romanes, insist on their pound of flesh in the matter of irrefragable demonstration. They complain of us for not bringing forward some one who has been able to detect the movement of the hour-hand of a watch during a second of time, and when we fail to do so, declare triumphantly that we have no evidence that there is any connection between the beating of a second and the movement of the hour-hand. When we say that rain comes from the condensation of moisture in the atmosphere, they demand of us a rain-drop from moisture not yet condensed. If they stickle for proof and cavil on the ninth part
of a hair, as they do when we bring forward what we deem excellent instances of the transmission of an acquired characteristic, why may not we, too, demand at any rate some evidence that the unmodified beetles actually did always, or nearly always, get blown out to sea, during the reduction above referred to, and that it is to this fact, and not to the masterly inactivity of their fathers and mothers, that the Madeira beetles owe their winglessness? If we began stickling for proof in this way, our opponents would not be long in letting us know that absolute proof is unattainable on any subject, that reasonable presumption is our highest certainty, and that crying out for too much evidence is as bad as accepting too little. Truth is like a photographic sensitised plate, which is equally ruined by over and by under exposure, and the just exposure for which can never be absolutely determined.

Surely if disuse can be credited with the vast powers involved in Mr. Darwin's statement that it has probably "been the main agent in rendering organs rudimentary," no
limits are assignable to the accumulated effects of habit, provided the effects of habit, or use and disuse, are supposed, as Mr. Darwin supposed them, to be inheritable at all. Darwinians have at length woke up to the dilemma in which they are placed by the manner in which Mr. Darwin tried to sit on the two stools of use and disuse, and natural selection of accidental variations, at the same time. The knell of Charles-Darwinism is rung in Mr. Wallace's present book, and in the general perception on the part of biologists that we must either assign to use and disuse such a predominant share in modification as to make it the feature most proper to be insisted on, or deny that the modifications, whether of mind or body, acquired during a single lifetime, are ever transmitted at all. If they can be inherited at all, they can be accumulated. If they can be accumulated at all, they can be so, for anything that appears to the contrary, to the extent of the specific and generic differences with which we are surrounded. The only thing to do is to pluck them out root and branch: they are as a
Essays on Life

cancer which, if the smallest fibre be left unexcised, will grow again, and kill any system on to which it is allowed to fasten. Mr. Wallace, therefore, may well be excused if he casts longing eyes towards Weismannism.

And what was Mr. Darwin's system? Who can make head or tail of the inextricable muddle in which he left it? The "Origin of Species" in its latest shape is the reduction of hedging to an absurdity. How did Mr. Darwin himself leave it in the last chapter of the last edition of the "Origin of Species"? He wrote:

"I have now recapitulated the facts and considerations which have thoroughly convinced me that species have been modified during a long course of descent. This has been effected chiefly through the natural selection of numerous, successive, slight, favourable variations; aided in an important manner by the inherited effects of the use and disuse of parts, and in an unimportant manner—that is, in relation to adaptive structures whether past or present—by the direct action of external conditions, and by variations which seem to us in our
ignorance to arise spontaneously. It appears that I formerly underrated the frequency and value of these latter forms of variation, as leading to permanent modifications of structure independently of natural selection."

The "numerous, successive, slight, favourable variations" above referred to are intended to be fortuitous, accidental, spontaneous. It is the essence of Mr. Darwin's theory that this should be so. Mr. Darwin's solemn statement, therefore, of his theory, after he had done his best or his worst with it, is, when stripped of surplusage, as follows:—

"The modification of species has been mainly effected by accumulation of spontaneous variations; it has been aided in an important manner by accumulation of variations due to use and disuse, and in an unimportant manner by spontaneous variations; I do not even now think that spontaneous variations have been very important, but I used once to think them less important than I do now."

It is a discouraging symptom of the age that such a system should have been so long belauded, and it is a sign of returning intelli-
gence that even he who has been more especially the *alter ego* of Mr. Darwin should have felt constrained to close the chapter of Charles-Darwinism as a living theory, and relegate it to the important but not very creditable place in history which it must henceforth occupy. It is astonishing, however, that Mr. Wallace should have quoted the extract from the "Origin of Species" just given, as he has done on p. 412 of his "Darwinism," without betraying any sign that he has caught its driftlessness—for drift, other than a desire to hedge, it assuredly has not got. The battle now turns on the question whether modifications of either structure or instinct due to use or disuse are ever inherited, or whether they are not. Can the effects of habit be transmitted to progeny at all? We know that more usually they are not transmitted to any perceptible extent, but we believe also that occasionally, and indeed not infrequently, they are inherited and even intensified. What are our grounds for this opinion? It will be my object to put these forward in the following number of the *Universal Review*.
THE DEADLOCK IN DARWINISM

PART II

At the close of my article in last month's number of the Universal Review, I said I would in this month's issue show why the opponents of Charles-Darwinism believe the effects of habits acquired during the lifetime of a parent to produce an effect on their sub-

1 Mr. J. T. Cunningham, of the Marine Biological Laboratory, Plymouth, has called my attention to the fact that I have ascribed to Professor Ray Lankester a criticism on Mr. Wallace's remarks upon the eyes of certain flat-fish, which Professor Ray Lankester was, in reality, only adopting—with full acknowledgment—from Mr. Cunningham. Mr. Cunningham has left it to me whether to correct my omission publicly or not, but he would so plainly prefer my doing so that I consider myself bound to insert this note. Curiously enough I find that in my book "Evolution Old and New," I gave what Lamarck actually said upon the eyes of flat-fish, and having been led to return to the subject, I may as well quote his words. He wrote:

"Need—always occasioned by the circumstances in which an animal is placed, and followed by sustained efforts at gratification—can not only modify an organ—that is to say, augment or reduce it—but can change its position when the case requires its removal.

"Ocean fishes have occasion to see what is on either side of..."
sequent offspring, in spite of the fact that we can rarely find the effect in any one generation, or even in several, sufficiently marked to arrest our attention.

I will now show that offspring can be, and not very infrequently is, affected by occurrences that have produced a deep impression on the parent organism—the effect produced on the offspring being such as leaves no doubt that it is to be connected with the impression produced on the parent. Having thus established the general proposition, I will proceed to the more particular one—that habits, involving use and disuse of special organs, with

them, and have their eyes accordingly placed on either side of their head. Some fishes, however, have their abode near coasts on submarine banks and inclinations, and are thus forced to flatten themselves as much as possible in order to get as near as they can to the shore. In this situation they receive more light from above than from below, and find it necessary to pay attention to whatever happens to be above them; this need has involved the displacement of their eyes, which now take the remarkable position which we observe in the case of soles, turbots, plaice, &c. The transfer of position is not even yet complete in the case of these fishes, and the eyes are not, therefore, symmetrically placed; but they are so with the skate, whose head and whole body are equally disposed on either side a longitudinal section. Hence the eyes of this fish are placed symmetrically upon the uppermost side.”—*Philosophie Zoologique*, tom. i., pp. 250, 251. Edition C. Martins. Paris, 1873.
Art and Science

the modifications of structure thereby engendered, produce also an effect upon offspring, which, though seldom perceptible as regards structure in a single, or even in several generations, is nevertheless capable of being accumulated in successive generations till it amounts to specific and generic difference. I have found the first point as much as I can treat within the limits of this present article, and will avail myself of the hospitality of the Universal Review next month to deal with the second.

The proposition which I have to defend is one which no one till recently would have questioned, and even now, those who look most askance at it do not venture to dispute it unreservedly; they every now and then admit it as conceivable, and even in some cases probable; nevertheless they seek to minimise it, and to make out that there is little or no connection between the great mass of the cells of which the body is composed, and those cells that are alone capable of reproducing the entire organism. The tendency is to assign to these last a life of their own, apart
from, and unconnected with that of the other cells of the body, and to cheapen all evidence that tends to prove any response on their part to the past history of the individual, and hence ultimately of the race.

Professor Weismann is the foremost exponent of those who take this line. He has naturally been welcomed by English Charles-Darwinians; for if his view can be sustained, then it can be contended that use and disuse produce no transmissible effect, and the ground is cut from under Lamarck's feet; if, on the other hand, his view is unfounded, the Lamarckian reaction, already strong, will gain still further strength. The issue, therefore, is important, and is being fiercely contested by those who have invested their all of reputation for discernment in Charles-Darwinian securities.

Professor Weismann's theory is, that at every new birth a part of the substance which proceeds from parents and which goes to form the new embryo is not used up in forming the new animal, but remains apart to generate the germ-cells—or perhaps I should say "germ-
plasm"—which the new animal itself will in due course issue.

Contrasting the generally received view with his own, Professor Weismann says that according to the first of these "the organism produces germ-cells afresh again and again, and that it produces them entirely from its own substance." While by the second "the germ-cells are no longer looked upon as the product of the parent's body, at least as far as their essential part—the specific germ-plasm—is concerned; they are rather considered as something which is to be placed in contrast with the *tout ensemble* of the cells which make up the parent's body, and the germ-cells of succeeding generations stand in a similar relation to one another as a series of generations of unicellular organisms arising by a continued process of cell-division."

On another page he writes:

"I believe that heredity depends upon the fact that a small portion of the effective substance of the germ, the germ-plasm, remains unchanged during the development of the

---

ovum into an organism, and that this part of the germ-plasm serves as a foundation from which the germ-cells of the new organism are produced. There is, therefore, continuity of the germ-plasm from one generation to another. One might represent the germ-plasm by the metaphor of a long creeping root-stock from which plants arise at intervals, these latter representing the individuals of successive generations.”

Mr. Wallace, who does not appear to have read Professor Weismann's essays themselves, but whose remarks are, no doubt, ultimately derived from the sequel to the passage just quoted from page 266 of Professor Weismann's book, contends that the impossibility of the transmission of acquired characters follows as a logical result from Professor Weismann's theory, inasmuch as the molecular structure of the germ-plasm that will go to form any succeeding generation is already predetermined within the still unformed embryo of its predecessor; "and Weismann," continues Mr. Wallace, "holds

that there are no facts which really prove that acquired characters can be inherited, although their inheritance has, by most writers, been considered so probable as hardly to stand in need of direct proof."  

Professor Weismann, in passages too numerous to quote, shows that he recognises this necessity, and acknowledges that the non-transmission of acquired characters "forms the foundation of the views" set forth in his book, p. 291.

Professor Ray Lankester does not commit himself absolutely to this view, but lends it support by saying (Nature, December 12, 1889): "It is hardly necessary to say that it has never yet been shown experimentally that anything acquired by one generation is transmitted to the next (putting aside diseases)."

Mr. Romanes, writing in Nature, March 13, 1890, and opposing certain details of Professor Weismann's theory, so far supports it as to say that "there is the gravest possible doubt lying against the supposition that any really inherited decrease is due to the inherited

1 "Darwinism," 1889, p. 440.
effects of disuse." The "gravest possible doubt" should mean that Mr. Romanes regards it as a moral certainty that disuse has no transmitted effect in reducing an organ, and it should follow that he holds use to have no transmitted effect in its development. The sequel, however, makes me uncertain how far Mr. Romanes intends this, and I would refer the reader to the article which Mr. Romanes has just published on Weismann in the Contemporary Review for this current month.

The burden of Mr. Thiselton Dyer's controversy with the Duke of Argyll (see Nature, January 16, 1890, et seq.) was that there was no evidence in support of the transmission of any acquired modification. The orthodoxy of science, therefore, must be held as giving at any rate a provisional support to Professor Weismann, but all of them, including even Professor Weismann himself, shrink from committing themselves to the opinion that the germ-cells of any organisms remain in all cases unaffected by the events that occur to the other cells of the same organism, and until
they do this they have knocked the bottom out of their case.

From among the passages in which Professor Weismann himself shows a desire to hedge I may take the following from page 170 of his book:—

"I am also far from asserting that the germ-plasm which, as I hold, is transmitted as the basis of heredity from one generation to another, is absolutely unchangeable or totally uninfluenced by forces residing in the organism within which it is transformed into germ-cells. I am also compelled to admit it as conceivable that organisms may exert a modifying influence upon their germ-cells, and even that such a process is to a certain extent inevitable. The nutrition and growth of the individual must exercise some influence upon its germ-cells . . . ."

Professor Weismann does indeed go on to say that this influence must be extremely slight, but we do not care how slight the changes produced may be provided they exist and can be transmitted. On an earlier page (p. 101) he said in regard to variations gener-
ally that we should not expect to find them conspicuous; their frequency would be enough, if they could be accumulated. The same applies here, if stirring events that occur to the somatic cells can produce any effect at all on offspring. A very small effect, provided it can be repeated and accumulated in successive generations, is all that even the most exacting Lamarckian will ask for.

Having now made the reader acquainted with the position taken by the leading Charles-Darwinian authorities, I will return to Professor Weismann himself, who declares that the transmission of acquired characters "at first sight certainly seems necessary," and that "it appears rash to attempt to dispense with its aid." He continues:—

"Many phenomena only appear to be intelligible if we assume the hereditary transmission of such acquired characters as the changes which we ascribe to the use or disuse of particular organs, or to the direct influence of climate. Furthermore, how can we explain instinct as hereditary habit, unless it has gradually arisen by the accumulation,
through heredity, of habits which were practised in succeeding generations?"¹

I may say in passing that Professor Weismann appears to suppose that the view of instinct just given is part of the Charles-Darwinian system, for on page 389 of his book he says "that many observers had followed Darwin in explaining them [instincts] as inherited habits." This was not Mr. Darwin's own view of the matter. He wrote:

"If we suppose any habitual action to become inherited—and I think it can be shown that this does sometimes happen—then the resemblance between what originally was a habit and an instinct becomes so close as not to be distinguished. . . . But it would be the most serious error to suppose that the greater number of instincts have been acquired by habit in one generation, and then transmitted by inheritance to succeeding generations. It can be clearly shown that the most wonderful instincts with which we are acquainted, namely, those of the hive-

¹ Page 83.
285
bee and of many ants, could not possibly have been thus acquired.”—[“Origin of Species,” ed., 1859, p. 209.]

Again we read: “Domestic instincts are sometimes spoken of as actions which have become inherited solely from long-continued and compulsory habit, but this, I think, is not true.”—Ibid., p. 214.

Again: “I am surprised that no one has advanced this demonstrative case of neuter insects, against the well-known doctrine of inherited habit, as advanced by Lamarck.”—[“Origin of Species,” ed. 1872, p. 233.]

I am not aware that Lamarck advanced the doctrine that instinct is inherited habit, but he may have done so in some work that I have not seen.

It is true, as I have more than once pointed out, that in the later editions of the “Origin of Species” it is no longer “the most serious” error to refer instincts generally to inherited habit, but it still remains “a serious error,” and this slight relaxation of severity does not warrant Professor Weismann in ascribing to Mr. Darwin an opinion which he emphatically
condemned. His tone, however, is so off-hand, that those who have little acquaintance with the literature of evolution would hardly guess that he is not much better informed on this subject than themselves.

Returning to the inheritance of acquired characters, Professor Weismann says that this has never been proved either by means of direct observation or by experiment. "It must be admitted," he writes, "that there are in existence numerous descriptions of cases which tend to prove that such mutilations as the loss of fingers, the scars of wounds, &c., are inherited by the offspring, but in these descriptions the previous history is invariably obscure, and hence the evidence loses all scientific value."

The experiments of M. Brown-Séquard throw so much light upon the question at issue that I will quote at some length from the summary given by Mr. Darwin in his "Variation of Animals and Plants under Domestication." Mr. Darwin writes:—

"With respect to the inheritance of struc-

1 Vol. i. p. 466, &c. Ed. 1885.
Essays on Life

tures mutilated by injuries or altered by disease, it was until lately difficult to come to any definite conclusion.” [Then follow several cases in which mutilations practised for many generations are not found to be transmitted.] “Notwithstanding,” continues Mr. Darwin, “the above several negative cases, we now possess conclusive evidence that the effects of operations are sometimes inherited. Dr. Brown-Séquard gives the following summary of his observations on guinea-pigs, and this summary is so important that I will quote the whole:

‘1st. Appearance of epilepsy in animals born of parents having been rendered epileptic by an injury to the spinal cord.

‘2nd. Appearance of epilepsy also in animals born of parents having been rendered epileptic by the section of the sciatic nerve.

‘3rd. A change in the shape of the ear in animals born of parents in which such a change was the effect of a division of the cervical sympathetic nerve.

‘4th. Partial closure of the eyelids in animals born of parents in which that state
of the eyelids had been caused either by the section of the cervical sympathetic nerve or the removal of the superior cervical ganglion.

"'5th. Exophthalmia in animals born of parents in which an injury to the restiform body had produced that protrusion of the eyeball. This interesting fact I have witnessed a good many times, and I have seen the transmission of the morbid state of the eye continue through four generations. In these animals modified by heredity, the two eyes generally protruded, although in the parents usually only one showed exophthalmia, the lesion having been made in most cases only on one of the corpora restiformia.

"'6th. Hæmatoma and dry gangrene of the ears in animals born of parents in which these ear-alterations had been caused by an injury to the restiform body near the nib of the calamus.

"'7th. Absence of two toes out of the three of the hind leg, and sometimes of the three, in animals whose parents had eaten up their hind-leg toes which had become anæsthetic from a section of the sciatic nerve alone, or
of that nerve and also of the crural. Sometimes, instead of complete absence of the toes, only a part of one or two or three was missing in the young, although in the parent not only the toes but the whole foot was absent (partly eaten off, partly destroyed by inflammation, ulceration, or gangrene).

"'8th. Appearance of various morbid states of the skin and hair of the neck and face in animals born of parents having had similar alterations in the same parts, as effects of an injury to the sciatic nerve.'

"It should be especially observed that Brown-Séquard has bred during thirty years many thousand guinea-pigs from animals which had not been operated upon, and not one of these manifested the epileptic tendency. Nor has he ever seen a guinea-pig born without toes, which was not the offspring of parents which had gnawed off their own toes owing to the sciatic nerve having been divided. Of this latter fact thirteen instances were carefully recorded, and a greater number were seen; yet Brown-Séquard speaks of such cases as one of the rarer forms of inheritance. It is
Art and Science

a still more interesting fact, 'that the sciatic nerve in the congenitally toeless animal has inherited the power of passing through all the different morbid states which have occurred in one of its parents from the time of the division till after its reunion with the peripheric end. It is not, therefore, simply the power of performing an action which is inherited, but the power of performing a whole series of actions, in a certain order.'

"In most of the cases of inheritance recorded by Brown-Séquard only one of the two parents had been operated upon and was affected. He concludes by expressing his belief that 'what is transmitted is the morbid state of the nervous system,' due to the operation performed on the parents."

Mr. Darwin proceeds to give other instances of inherited effects of mutilations:—

"With the horse there seems hardly a doubt that exostoses on the legs, caused by too much travelling on hard roads, are inherited. Blumenbach records the case of a man who had his little finger on the right hand almost cut off, and which in consequence
Essays on Life

grew crooked, and his sons had the same finger on the same hand similarly crooked. A soldier, fifteen years before his marriage, lost his left eye from purulent ophthalmia, and his two sons were microphthalmic on the same side."

The late Professor Rolleston, whose competence as an observer no one is likely to dispute, gave Mr. Darwin two cases as having fallen under his own notice, one of a man whose knee had been severely wounded, and whose child was born with the same spot marked or scarred, and the other of one who was severely cut upon the cheek, and whose child was born scarred in the same place. Mr. Darwin's conclusion was that "the effects of injuries, especially when followed by disease, or perhaps exclusively when thus followed, are occasionally inherited."

Let us now see what Professor Weismann has to say against this. He writes:

"The only cases worthy of discussion are the well-known experiments upon guinea-pigs conducted by the French physiologist, Brown-Séquard. But the explanation of his results
is, in my opinion, open to discussion. In these cases we have to do with the apparent transmission of artificially produced malformations. . . . All these effects were said to be transmitted to descendants as far as the fifth or sixth generation.

"But we must inquire whether these cases are really due to heredity, and not to simple infection. In the case of epilepsy, at any rate, it is easy to imagine that the passage of some specific organism through the reproductive cells may take place, as in the case of syphilis. We are, however, entirely ignorant of the nature of the former disease. This suggested explanation may not perhaps apply to the other cases; but we must remember that animals which have been subjected to such severe operations upon the nervous system have sustained a great shock, and if they are capable of breeding, it is only probable that they will produce weak descendants, and such as are easily affected by disease. Such a result does not, however, explain why the offspring should suffer from the same disease as that which was artificially induced in the
parents. But this does not appear to have been by any means invariably the case. Brown-Séquard himself says: 'The changes in the eye of the offspring were of a very variable nature, and were only occasionally exactly similar to those observed in the parents.'

"There is no doubt, however, that these experiments demand careful consideration, but before they can claim scientific recognition, they must be subjected to rigid criticism as to the precautions taken, the nature and number of the control experiments, &c.

"Up to the present time such necessary conditions have not been sufficiently observed. The recent experiments themselves are only described in short preliminary notices, which, as regards their accuracy, the possibility of mistake, the precautions taken, and the exact succession of individuals affected, afford no data on which a scientific opinion can be founded" (pp. 81, 82).

The line Professor Weismann takes, therefore, is to discredit the facts; yet on a later page we find that the experiments have since been repeated by Obersteiner, "who has
Art and Science

described them in a very exact and unprejudiced manner,” and that “the fact”—(I imagine that Professor Weismann intends “the facts”)—“cannot be doubted.”

On a still later page, however, we read:—

“If, for instance, it could be shown that artificial mutilation spontaneously reappears in the offspring with sufficient frequency to exclude all possibilities of chance, then such proof [i.e., that acquired characters can be transmitted] would be forthcoming. The transmission of mutilations has been frequently asserted, and has been even recently again brought forward, but all the supposed instances have broken down when carefully examined” (p. 390).

Here, then, we are told that proof of the occasional transmission of mutilations would be sufficient to establish the fact, but on p. 267 we find that no single fact is known which really proves that acquired characters can be transmitted, “for the ascertained facts which seem to point to the transmission of artificially produced diseases cannot be considered as proof.” [Italics mine.] Perhaps; but it was
mutilation in many cases that Professor Weismann practically admitted to have been transmitted when he declared that Obersteiner had verified Brown-Séquard's experiments.

That Professor Weismann recognises the vital importance to his own theory of the question whether or no mutilations can be transmitted under any circumstances, is evident from a passage on p. 425 of his work, on which he says: "It can hardly be doubted that mutilations are acquired characters; they do not arise from any tendency contained in the germ, but are merely the reaction of the body under certain external influences. They are, as I have recently expressed it, purely somatogenic characters—viz., characters which emanate from the body (soma) only, as opposed to the germ-cells; they are, therefore, characters that do not arise from the germ itself.

"If mutilations must necessarily be transmitted" [which no one that I know of has maintained], "or even if they might occasionally be transmitted" [which cannot, I imagine, be reasonably questioned], "a powerful
support would be given to the Lamarckian principle, and the transmission of functional hypertrophy or atrophy would thus become highly probable."

I have not found any further attempt in Professor Weismann's book to deal with the evidence adduced by Mr. Darwin to show that mutilations, if followed by diseases, are sometimes inherited; and I must leave it to the reader to determine how far Professor Weismann has shown reason for rejecting Mr. Darwin's conclusion. I do not, however, dwell upon these facts now as evidence of a transmitted change of bodily form, or of instinct due to use and disuse or habit; what they prove is that the germ-cells within the parent's body do not stand apart from the other cells of the body so completely as Professor Weismann would have us believe, but that, as Professor Hering, of Prague, has aptly said, they echo with more or less frequency and force to the profounder impressions made upon other cells.

I may say that Professor Weismann does not more cavalierly wave aside the mass of
Essays on Life

evidence collected by Mr. Darwin and a host of other writers, to the effect that mutilations are sometimes inherited, than does Mr. Wallace, who says that, "as regards mutilations, it is generally admitted that they are not inherited, and there is ample evidence on this point." It is indeed generally admitted that mutilations, when not followed by disease, are very rarely, if ever, inherited; and Mr. Wallace's appeal to the "ample evidence" which he alleges to exist on this head, is much as though he should say that there is ample evidence to show that the days are longer in summer than in winter. "Nevertheless," he continues, "a few cases of apparent inheritance of mutilations have been recorded, and these, if trustworthy, are difficulties in the way of the theory." . . . "The often-quoted case of a disease induced by mutilation being inherited (Brown-Séquard's epileptic guinea-pigs) has been discussed by Professor Weismann and shown to be not conclusive. The mutilation itself—a section of certain nerves—was never inherited, but the resulting epilepsy, or a general state of weakness, deformity, or sores,
Art and Science

was sometimes inherited. It is, however, possi-
ble that the mere injury introduced and
encouraged the growth of certain microbes,
which, spreading through the organism, some-
times reached the germ-cells, and thus trans-
mitted a diseased condition to the offspring."¹

I suppose a microbe which made guinea-
pigs eat their toes off was communicated to
the germ-cells of an unfortunate guinea-pig
which had been already microbed by it, and
made the offspring bite its toes off too. The
microbe has a good deal to answer for.

On the case of the deterioration of horses in
the Falkland Islands after a few generations,
Professor Weismann says:—

"In such a case we have only to assume
that the climate which is unfavourable, and
the nutriment which is insufficient for horses,
affect not only the animal as a whole but also
its germ-cells. This would result in the dimi-
nution in size of the germ-cells, the effects
upon the offspring being still further intensi-
fied by the insufficient nourishment supplied
during growth. But such results would not

¹ "Darwinism," p. 440.
depend upon the transmission by the germ-cells of certain peculiarities due to the unfavourable climate, which only appear in the full-grown horse."

But Professor Weismann does not like such cases, and admits that he cannot explain the facts in connection with the climatic varieties of certain butterflies, except "by supposing the passive acquisition of characters produced by the direct influence of climate."

Nevertheless in his next paragraph but one he calls such cases "doubtful," and proposes that for the moment they should be left aside. He accordingly leaves them, but I have not yet found what other moment he considered auspicious for returning to them. He tells us that "new experiments will be necessary, and that he has himself already begun to undertake them." Perhaps he will give us the results of these experiments in some future book—for that they will prove satisfactory to him can hardly, I think, be doubted. He writes:—

"Leaving on one side, for the moment, these doubtful and insufficiently investigated cases, we may still maintain that the assumption
that changes induced by external conditions in the organism as a whole are communicated to the germ-cells after the manner indicated in Darwin's hypothesis of pangenesis, is wholly unnecessary for the explanation of these phenomena. Still we cannot exclude the possibility of such a transmission occasionally occurring, for even if the greater part of the effects must be attributable to natural selection, there might be a smaller part in certain cases which depends on this exceptional factor."

I repeatedly tried to understand Mr. Darwin's theory of pangenesis, and so often failed that I long since gave the matter up in despair. I did so with the less unwillingness because I saw that no one else appeared to understand the theory, and that even Mr. Darwin's warmest adherents regarded it with disfavour. If Mr. Darwin means that every cell of the body throws off minute particles that find their way to the germ-cells, and hence into the new embryo, this is indeed difficult of comprehension and belief. If he means that the rhythms or vibrations that go on ceaselessly in every cell of the body communicate
themselves with greater or less accuracy or perturbation, as the case may be, to the cells that go to form offspring, and that since the characteristics of matter are determined by vibrations, in communicating vibrations they in effect communicate matter, according to the view put forward in the last chapter of my book "Luck or Cunning,"¹ then we can better understand it. I have nothing, however, to do with Mr. Darwin's theory of pangenesis beyond avoiding the pretence that I understand either the theory itself or what Professor Weismann says about it; all I am concerned with is Professor Weismann's admission, made immediately afterwards, that the somatic cells may, and perhaps sometimes do, impart characteristics to the germ-cells.

"A complete and satisfactory refutation of such an opinion," he continues, "cannot be brought forward at present"; so I suppose we must wait a little longer, but in the meantime we may again remark that, if we admit even occasional communication of changes in the somatic cells to the germ-cells, we have

¹ Longmans, 1890.
let in the thin end of the wedge, as Mr. Darwin did when he said that use and disuse did a good deal towards modification. Buffon, in his first volume on the lower animals,¹ dwells on the impossibility of stopping the breach once made by admission of variation at all. "If the point," he writes, "were once gained, that among animals and vegetables there had been, I do not say several species, but even a single one, which had been produced in the course of direct descent from another species; if, for example, it could be once shown that the ass was but a degeneration from the horse—then there is no farther limit to be set to the power of Nature, and we should not be wrong in supposing that with sufficient time she could have evolved all other organised forms from one primordial type." So with use and disuse and transmission of acquired characteristics generally—once show that a single structure or instinct is due to habit in preceding generations, and we can impose no limit on the results achievable by accumulation in this respect, nor

shall we be wrong in conceiving it as possible that all specialisation, whether of structure or instinct, may be due ultimately to habit.

How far this can be shown to be probable is, of course, another matter, but I am not immediately concerned with this; all I am concerned with now is to show that the germ-cells not unfrequently become permanently affected by events that have made a profound impression upon the somatic cells, in so far that they transmit an obvious reminiscence of the impression to the embryos which they go subsequently towards forming. This is all that is necessary for my case, and I do not find that Professor Weismann, after all, disputes it.

But here, again, comes the difficulty of saying what Professor Weismann does, and what he does not, dispute. One moment he gives all that is wanted for the Lamarckian contention, the next he denies common-sense the bare necessaries of life. For a more exhaustive and detailed criticism of Professor Weismann's position, I would refer the reader to an admirably clear article by Mr. Sidney
Art and Science

H. Vines, which appeared in Nature, October 24, 1889. I can only say that while reading Professor Weismann's book, I feel as I do when I read those of Mr. Darwin, and of a good many other writers on biology whom I need not name. I become like a fly in a window-pane. I see the sunshine and freedom beyond, and buzz up and down their pages, ever hopeful to get through them to the fresh air without, but ever kept back by a mysterious something, which I feel but cannot either grasp or see. It was not thus when I read Buffon, Erasmus Darwin, and Lamarck; it is not thus when I read such articles as Mr. Vines's just referred to. Love of self-display, and the want of singleness of mind that it inevitably engenders—these, I suppose, are the sins that glaze the casements of most men's minds; and from these, no matter how hard he tries to free himself, nor how much he despises them, who is altogether exempt?

Finally, then, when we consider the immense mass of evidence referred to briefly, but sufficiently, by Mr. Charles Darwin, and
referred to without other, for the most part, than off-hand dismissal by Professor Weismann in the last of the essays that have been recently translated, I do not see how any one who brings an unbiased mind to the question can hesitate as to the side on which the weight of testimony inclines. Professor Weismann declares that "the transmission of mutilations may be dismissed into the domain of fable." If so, then, whom can we trust? What is the use of science at all if the conclusions of a man as competent as I readily admit Mr. Darwin to have been, on the evidence laid before him from countless sources, is to be set aside lightly and without giving the clearest and most cogent explanation of the why and wherefore? When we see a person "ostrichising" the evidence which he has to meet, as clearly as I believe Professor Weismann to be doing, we shall in nine cases out of ten be right in supposing that he knows the evidence to be too strong for him.

1 Essays, &c., p. 447.
THE DEADLOCK IN DARWINISM

PART III

Now let me return to the recent division of biological opinion into two main streams—Lamarckism and Weismannism. Both Lamarckians and Weismannists, not to mention mankind in general, admit that the better adapted to its surroundings a living form may be, the more likely it is to outbreed its competitors. The world at large, again, needs not to be told that the normal course is not unfrequently deflected through the fortunes of war; nevertheless, according to Lamarckians and Erasmus-Darwinians, habitual effort, guided by ever-growing intelligence—that is to say, by continued increase of power in the matter of knowing our likes and dislikes—has been so much the main factor throughout the course of organic development, that the rest, though not lost sight of, may be allowed to go without saying. According, on the
other hand, to extreme Charles-Darwinians and Weismannists, habit, effort and intelligence acquired during the experience of any one life goes for nothing. Not even a little fraction of it endures to the benefit of offspring. It dies with him in whom it is acquired, and the heirs of a man's body take no interest therein. To state this doctrine is to arouse instinctive loathing; it is my fortunate task to maintain that such a nightmare of waste and death is as baseless as it is repulsive.

The split in biological opinion occasioned by the deadlock to which Charles-Darwinism has been reduced, though comparatively recent, widens rapidly. Ten years ago Lamarck's name was mentioned only as a byword for extravagance; now, we cannot take up a number of *Nature* without seeing how hot the contention is between his followers and those of Weismann. This must be referred, as I implied earlier, to growing perception that Mr. Darwin should either have gone farther towards Lamarckism or not so far. In admitting use and disuse as freely as he did, he gave Lamarckians leverage for the
overthrow of a system based ostensibly on the accumulation of fortunate accidents. In assigning the lion's share of development to the accumulation of fortunate accidents, he tempted fortuitists to try to cut the ground from under Lamarck's feet by denying that the effects of use and disuse can be inherited at all. When the public had once got to understand what Lamarck had intended, and wherein Mr. Charles Darwin had differed from him, it became impossible for Charles-Darwinians to remain where they were, nor is it easy to see what course was open to them except to cast about for a theory by which they could get rid of use and disuse altogether. Weismannism, therefore, is the inevitable outcome of the straits to which Charles-Darwinians were reduced through the way in which their leader had halted between two opinions.

This is why Charles-Darwinians, from Professor Huxley downwards, have kept the difference between Lamarck's opinions and those of Mr. Darwin so much in the background. Unwillingness to make this under-
stood is nowhere manifested more clearly than in Dr. Francis Darwin's life of his father. In this work Lamarck is sneered at once or twice, and told to go away, but there is no attempt to state the two cases side by side; from which, as from not a little else, I conclude that Dr. Francis Darwin has descended from his father with singularly little modification.

Proceeding to the evidence for the transmissions of acquired habits, I will quote two recently adduced examples from among the many that have been credibly attested. The first was contributed to Nature (March 14, 1889) by Professor Marcus M. Hartog, who wrote:

“A. B. is moderately myopic and very astigmatic in the left eye; extremely myopic in the right. As the left eye gave such bad images for near objects, he was compelled in childhood to mask it, and acquired the habit of leaning his head on his left arm for writing, so as to blind that eye, or of resting the left temple and eye on the hand, with the elbow on the table. At the age of fifteen the eyes
Art and Science

were equalised by the use of suitable spectacles, and he soon lost the habit completely and permanently. He is now the father of two children, a boy and a girl, whose vision (tested repeatedly and fully) is emmetropic in both eyes, so that they have not inherited the congenital optical defect of their father. All the same, they have both of them inherited his early acquired habit, and need constant watchfulness to prevent their hiding the left eye when writing, by resting the head on the left forearm or hand. Imitation is here quite out of the question.

"Considering that every habit involves changes in the proportional development of the muscular and osseous systems, and hence probably of the nervous system also, the importance of inherited habits, natural or acquired, cannot be overlooked in the general theory of inheritance. I am fully aware that I shall be accused of flat Lamarckism, but a nickname is not an argument."

To this Professor Ray Lankester rejoined (Nature, March 21, 1889):

"It is not unusual for children to rest the
head on the left forearm or hand when writing, and I doubt whether much value can be attached to the case described by Professor Hartog. The kind of observation which his letter suggests is, however, likely to lead to results either for or against the transmission of acquired characters. An old friend of mine lost his right arm when a schoolboy, and has ever since written with his left. He has a large family and grandchildren, but I have not heard of any of them showing a disposition to left-handedness."

From Nature (March 21, 1889) I take the second instance communicated by Mr. J. Jenner-Weir, who wrote as follows:—

"Mr. Marcus M. Hartog’s letter of March 6th, inserted in last week’s number (p. 462), is a very valuable contribution to the growing evidence that acquired characters may be inherited. I have long held the view that such is often the case, and I have myself observed several instances of the, at least I may say, apparent fact.

"Many years ago there was a very fine male of the Capra megaceros in the gardens
of the Zoological Society. To restrain this animal from jumping over the fence of the enclosure in which he was confined, a long and heavy chain was attached to the collar round his neck. He was constantly in the habit of taking this chain up by his horns and moving it from one side to another over his back; in doing this he threw his head very much back, his horns being placed in a line with the back. The habit had become quite chronic with him, and was very tiresome to look at. I was very much astonished to observe that his offspring inherited the habit, and although it was not necessary to attach a chain to their necks, I have often seen a young male throwing his horns over his back and shifting from side to side an imaginary chain. The action was exactly the same as that of his ancestor. The case of the kid of this goat appears to me to be parallel to that of child and parent given by Mr. Hartog. I think at the time I made this observation I informed Mr. Darwin of the fact by letter, and he did not accuse me of 'flat Lamarckism.'"

To this letter there was no rejoinder. It
may be said, of course, that the action of the offspring in each of these cases was due to accidental coincidence only. Anything can be said, but the question turns not on what an advocate can say, but on what a reasonably intelligent and disinterested jury will believe; granted they might be mistaken in accepting the foregoing stories, but the world of science, like that of commerce, is based on the faith or confidence, which both creates and sustains them. Indeed the universe itself is but the creature of faith, for assuredly we know of no other foundation. There is nothing so generally and reasonably accepted—not even our own continued identity—but questions may be raised about it that will shortly prove unanswerable. We cannot so test every six-pence given us in change as to be sure that we never take a bad one, and had better sometimes be cheated than reduce caution to an absurdity. Moreover, we have seen from the evidence given in my preceding article that the germ-cells issuing from a parent's body can, and do, respond to profound impressions made on the somatic-cells. This being so,
Art and Science

what impressions are more profound, what needs engage more assiduous attention than those connected with self-protection, the procuring of food, and the continuation of the species? If the mere anxiety connected with an ill-healing wound inflicted on but one generation is sometimes found to have so impressed the germ-cells that they hand down its scars to offspring, how much more shall not anxieties that have directed action of all kinds from birth till death, not in one generation only but in a longer series of generations than the mind can realise to itself, modify, and indeed control, the organisation of every species?

I see Professor S. H. Vines, in the article on Weismann's theory referred to in my preceding article, says Mr. Darwin "held that it was not the sudden variations due to altered external conditions which become permanent, but those slowly produced by what he termed 'the accumulative action of changed conditions of life.'" Nothing can be more soundly Lamarckian, and nothing should more conclusively show that, whatever else Mr. Darwin was, he
was not a Charles-Darwinian; but what evi-
dence other than inferential can from the
nature of the case be adduced in support of
this, as I believe, perfectly correct judgment?
None know better than they who clamour for
direct evidence that their master was right in
taking the position assigned to him by Pro-
fessor Vines, that they cannot reasonably look
for it. With us, as with themselves, modifica-
tion proceeds very gradually, and it violates
our principles as much as their own to ex-
pect visible permanent progress, in any single
generation, or indeed in any number of genera-
tions of wild species which we have yet had
time to observe. Occasionally we can find
such cases, as in that of *Branchipus stagnalis*,
quoted by Mr. Wallace, or in that of the New
Zealand Kea whose skin, I was assured by
the late Sir Julius von Haast, has already
been modified as a consequence of its change
of food. Here we can show that in even a
few generations structure is modified under
changed conditions of existence, but as we
believe these cases to occur comparatively
rarely, so it is still more rarely that they occur
Art and Science

when and where we can watch them. Nature is eminently conservative, and fixity of type, even under considerable change of conditions, is surely more important for the well-being of any species than an over-ready power of adaptation to, it may be, passing changes. There could be no steady progress if each generation were not mainly bound by the traditions of those that have gone before it. It is evolution and not incessant revolution that both parties are upholding; and this being so, rapid visible modification must be the exception, not the rule. I have quoted direct evidence adduced by competent observers, which is, I believe, sufficient to establish the fact that offspring can be and is sometimes modified by the acquired habits of a progenitor. I will now proceed to the still more, as it appears to me, cogent proof afforded by general considerations.

What, let me ask, are the principal phenomena of heredity? There must be physical continuity between parent, or parents, and offspring, so that the offspring is, as Erasmus
Essays on Life

Darwin well said, a kind of elongation of the life of the parent.

Erasmus Darwin put the matter so well that I may as well give his words in full; he wrote:

"Owing to the imperfection of language the offspring is termed a new animal, but is in truth a branch or elongation of the parent, since a part of the embryon animal is, or was, a part of the parent, and therefore, in strict language, cannot be said to be entirely new at the time of its production; and therefore it may retain some of the habits of the parent system.

"At the earliest period of its existence the embryon would seem to consist of a living filament with certain capabilities of irritation, sensation, volition, and association, and also with some acquired habits or propensities peculiar to the parent; the former of these are in common with other animals; the latter seem to distinguish or produce the kind of animal, whether man or quadruped, with the similarity of feature or form to the parent."  

318
Art and Science

Those who accept evolution insist on unbroken physical continuity between the earliest known life and ourselves, so that we both are and are not personally identical with the unicellular organism from which we have descended in the course of many millions of years, exactly in the same way as an octogenarian both is and is not personally identical with the microscopic impregnate ovum from which he grew up. Everything both is and is not. There is no such thing as strict identity between any two things in any two consecutive seconds. In strictness they are identical and yet not identical, so that in strictness they violate a fundamental rule of strictness—namely, that a thing shall never be itself and not itself at one and the same time; we must choose between logic and dealing in a practical spirit with time and space; it is not surprising, therefore, that logic, in spite of the show of respect outwardly paid to her, is told to stand aside when people come to practice. In practice identity is generally held to exist where continuity is only broken slowly and piecemeal, neverthe-
less, that occasional periods of even rapid change are not held to bar identity, appears from the fact that no one denies this to hold between the microscopically small impregnate ovum and the born child that springs from it, nor yet, therefore, between the impregnate ovum and the octogenarian into which the child grows; for both ovum and octogenarian are held personally identical with the newborn baby, and things that are identical with the same are identical with one another.

The first, then, and most important element of heredity is that there should be unbroken continuity, and hence sameness of personality, between parents and offspring, in neither more nor less than the same sense as that in which any other two personalities are said to be the same. The repetition, therefore, of its developmental stages by any offspring must be regarded as something which the embryo repeating them has already done once, in the person of one or other parent; and if once, then, as many times as there have been generations between any given embryo now repeating it, and the point in life from which
we started—say, for example, the amœba. In the case of asexually and sexually produced organisms alike, the offspring must be held to continue the personality of the parent or parents, and hence on the occasion of every fresh development, to be repeating something which in the person of its parent or parents it has done once, and if once, then any number of times, already.

It is obvious, therefore, that the germ-plasm (or whatever the fancy word for it may be) of any one generation is as physically identical with the germ-plasm of its predecessor as any two things can be. The difference between Professor Weismann and, we will say, Heringians consists in the fact that the first maintains the new germ-plasm when on the point of repeating its developmental processes to take practically no cognisance of anything that has happened to it since the last occasion on which it developed itself; while the latter maintain that offspring takes much the same kind of account of what has happened to it in the persons of its parents since the last occasion on which it developed itself, as people in ordinary life take of things that happen to
Essays on Life

them. In daily life people let fairly normal circumstances come and go without much heed as matters of course. If they have been lucky they make a note of it and try to repeat their success. If they have been unfortunate but have recovered rapidly they soon forget it; if they have suffered long and deeply they grizzle over it and are scared and scarred by it for a long time. The question is one of cognisance or non-cognisance on the part of the new germs, of the more profound impressions made on them while they were one with their parents, between the occasion of their last preceding development, and the new course on which they are about to enter. Those who accept the theory put forward independently by Professor Hering of Prague (whose work on this subject is translated in my book, "Unconscious Memory") and by myself in "Life and Habit," believe in cognizance, as do Lamarckians generally. Weismannites, and with them the orthodoxy of English science, find non-cognisance more acceptable.

If the Heringian view is accepted, that heredity is only a mode of memory, and an

1 Longmans, 1890.  
2 Longmans, 1890.
extension of memory from one generation to another, then the repetition of its development by any embryo thus becomes only the repetition of a lesson learned by rote; and, as I have elsewhere said, our view of life is simplified by finding that it is no longer an equation of, say, a hundred unknown quantities, but of ninety-nine only, inasmuch as two of the unknown quantities prove to be substantially identical. In this case the inheritance of acquired characteristics cannot be disputed, for it is postulated in the theory that each embryo takes note of, remembers and is guided by the profounder impressions made upon it while in the persons of its parents, between its present and last preceding development. To maintain this is to maintain use and disuse to be the main factors throughout organic development; to deny it is to deny that use and disuse can have any conceivable effect. For the detailed reasons which led me to my own conclusions I must refer the reader to my books, "Life and Habit"¹ and "Unconscious Memory,"¹ the conclusions of which have been often adopted,

¹ Longmans, 1890.
but never, that I have seen, disputed. A brief résumé of the leading points in the argument is all that space will here allow me to give.

We have seen that it is a first requirement of heredity that there shall be physical continuity between parents and offspring. This holds good with memory. There must be continued identity between the person remembering and the person to whom the thing that is remembered happened. We cannot remember things that happened to someone else, and in our absence. We can only remember having heard of them. We have seen, however, that there is as much bonâ-fide sameness of personality between parents and offspring up to the time at which the offspring quits the parent's body, as there is between the different states of the parent himself at any two consecutive moments; the offspring therefore, being one and the same person with its progenitors until it quits them, can be held to remember what happened to them within, of course, the limitations to which all memory is subject, as much as the progenitors can remember what happened earlier to themselves. Whether it
Art and Science

does so remember can only be settled by observing whether it acts as living beings commonly do when they are acting under guidance of memory. I will endeavour to show that, though heredity and habit based on memory go about in different dresses, yet if we catch them separately—for they are never seen together—and strip them there is not a mole nor strawberry-mark, nor trick nor leer of the one, but we find it in the other also.

What are the moles and strawberry-marks of habitual action, or actions remembered and thus repeated? First, the more often we repeat them the more easily and unconsciously we do them. Look at reading, writing, walking, talking, playing the piano, &c.; the longer we have practised any one of these acquired habits, the more easily, automatically and unconsciously, we perform it. Look, on the other hand, broadly, at the three points to which I called attention in "Life and Habit":—

I. That we are most conscious of and have most control over such habits as speech, the upright position, the arts and sciences—
which are acquisitions peculiar to the human race, always acquired after birth, and not common to ourselves and any ancestor who had not become entirely human.

II. That we are less conscious of and have less control over eating and drinking [provided the food be normal], swallowing, breathing, seeing, and hearing—which were acquisitions of our prehuman ancestry, and for which we had provided ourselves with all the necessary apparatus before we saw light, but which are still, geologically speaking, recent.

III. That we are most unconscious of and have least control over our digestion and circulation—powers possessed even by our invertebrate ancestry, and, geologically speaking, of extreme antiquity.

I have put the foregoing very broadly, but enough is given to show the reader the gist of the argument. Let it be noted that disturbance and departure, to any serious extent, from normal practice tends to induce resumption of consciousness even in the case of such old habits as breathing, seeing, and hearing, digestion and the circulation of the blood. So it is with habitual actions in general. Let a
player be never so proficient on any instrument, he will be put out if the normal conditions under which he plays are too widely departed from, and will then do consciously, if indeed he can do it at all, what he had hitherto been doing unconsciously. It is an axiom as regards actions acquired after birth, that we never do them automatically save as the result of long practice; the stages in the case of any acquired facility, the inception of which we have been able to watch, have invariably been from a nothingness of ignorant impotence to a little somethingness of highly self-conscious, arduous performance, and thence to the unself-consciousness of easy mastery. I saw one year a poor blind lad of about eighteen sitting on a wall by the wayside at Varese, playing the concertina with his whole body, and snorting like a child. The next year the boy no longer snorted, and he played with his fingers only; the year after that he seemed hardly to know whether he was playing or not, it came so easily to him. I know no exception to this rule. Where is the intricate and at one time difficult art in which perfect automatic ease has been reached except as the
result of long practice? If, then, wherever we can trace the development of automatism we find it to have taken this course, is it not most reasonable to infer that it has taken the same even when it has risen in regions that are beyond our ken? Ought we not, whenever we see a difficult action performed, automatically to suspect antecedent practice? Granted that without the considerations in regard to identity presented above it would not have been easy to see where a baby of a day old could have had the practice which enables it to do as much as it does unconsciously, but even without these considerations it would have been more easy to suppose that the necessary opportunities had not been wanting, than that the easy performance could have been gained without practice and memory.

When I wrote “Life and Habit” (originally published in 1877) I said in slightly different words:—

“Shall we say that a baby of a day old sucks (which involves the whole principle of the pump and hence a profound practical knowledge of the laws of pneumatics and hydrostatics), digests, oxygenises its blood—
Art and Science

millions of years before any one had discovered oxygen—sees and hears, operations that involve an unconscious knowledge of the facts concerning optics and acoustics compared with which the conscious discoveries of Newton are insignificant—shall we say that a baby can do all these things at once, doing them so well and so regularly without being even able to give them attention, and yet without mistake, and shall we also say at the same time that it has not learnt to do them, and never did them before?

"Such an assertion would contradict the whole experience of mankind."

I have met with nothing during the thirteen years since the foregoing was published that has given me any qualms about its soundness. From the point of view of the law courts and everyday life it is, of course, nonsense; but in the kingdom of thought, as in that of heaven, there are many mansions, and what would be extravagance in the cottage or farmhouse, as it were, of daily practice, is but common decency in the palace of high philosophy, wherein dwells evolution. If we leave evolution alone, we may stick to common
practice and the law courts; touch evolution and we are in another world; not higher, not lower, but different as harmony from counterpoint. As, however, in the most absolute counterpoint there is still harmony, and in the most absolute harmony still counterpoint, so high philosophy should be still in touch with common sense, and common sense with high philosophy.

The common-sense view of the matter to people who are not over-curious and to whom time is money, will be that a baby is not a baby until it is born, and that when born it should be born in wedlock. Nevertheless, as a sop to high philosophy, every baby is allowed to be the offspring of its father and mother.

The high-philosophy view of the matter is that every human being is still but a fresh edition of the primordial cell with the latest additions and corrections; there has been no leap nor break in continuity anywhere; the man of to-day is the primordial cell of millions of years ago as truly as he is the himself of yesterday; he can only be denied to be the one on grounds that will prove him not to be the other. Every one is both himself and all
his direct ancestors and descendants as well; therefore, if we would be logical, he is one also with all his cousins, no matter how distant, for he and they are alike identical with the primordial cell, and we have already noted it as an axiom that things which are identical with the same are identical with one another. This is practically making him one with all living things, whether animal or vegetable, that ever have existed or ever will—something of all which may have been in the mind of Sophocles when he wrote:

"Nor seest thou yet the gathering hosts of ill
That shall en-one thee both with thine own self
And with thine offspring."

And all this has come of admitting that a man may be the same person for two days running! As for sopping common sense it will be enough to say that these remarks are to be taken in a strictly scientific sense, and have no appreciable importance as regards life and conduct. True they deal with the foundations on which all life and conduct are based, but like other foundations they are hidden out of sight, and the sounder they are, the less we trouble ourselves about them. 

331
What other main common features between heredity and memory may we note besides the fact that neither can exist without that kind of physical continuity which we call personal identity? First, the development of the embryo proceeds in an established order; so must all habitual actions based on memory. Disturb the normal order and the performance is arrested. The better we know "God save the Queen," the less easily can we play or sing it backwards. The return of memory again depends on the return of ideas associated with the particular thing that is remembered—we remember nothing but for the presence of these, and when enough of these are presented to us we remember everything. So, if the development of an embryo is due to memory, we should suppose the memory of the impregnate ovum to revert not to yesterday, when it was in the persons of its parents, but to the last occasion on which it was an impregnate ovum. The return of the old environment and the presence of old associations would at once involve recollection of the course that should be next taken, and the same should happen throughout the whole
Art and Science

course of development. The actual course of development presents precisely the phenomena agreeable with this. For fuller treatment of this point I must refer the reader to the chapter on the abeyance of memory in my book "Life and Habit," already referred to.

Secondly, we remember best our last few performances of any given kind, so our present performance will probably resemble some one or other of these; we remember our earlier performances by way of residuum only, but every now and then we revert to an earlier habit. This feature of memory is manifested in heredity by the way in which offspring commonly resembles most its nearer ancestors, but sometimes reverts to earlier ones. Brothers and sisters, each as it were giving their own version of the same story, but in different words, should generally resemble each other more closely than more distant relations. And this is what actually we find.

Thirdly, the introduction of slightly new elements into a method already established varies it beneficially; the new is soon fused with the old, and the monotony ceases to be
oppressive. But if the new be too foreign, we cannot fuse the old and the new—nature seeming to hate equally too wide a deviation from ordinary practice and none at all. This fact reappears in heredity as the beneficial effects of occasional crossing on the one hand, and on the other, in the generally observed sterility of hybrids. If heredity be an affair of memory, how can an embryo, say of a mule, be expected to build up a mule on the strength of but two mule-memories? Hybridism causes a fault in the chain of memory, and it is to this cause that the usual sterility of hybrids must be referred.

Fourthly, it requires many repeated impressions to fix a method firmly, but when it has been engrained into us we cease to have much recollection of the manner in which it came to be so, or indeed of any individual repetition, but sometimes a single impression, if prolonged as well as profound, produces a lasting impression and is liable to return with sudden force, and then to go on returning to us at intervals. As a general rule, however, abnormal impressions cannot long hold their own against the overwhelming preponderance of normal autho-
Art and Science

rity. This appears in heredity as the normal non-inheritance of mutilations on the one hand, and on the other as their occasional inheritance in the case of injuries followed by disease.

Fifthly, if heredity and memory are essentially the same, we should expect that no animal would develop new structures of importance after the age at which its species begins ordinarily to continue its race; for we cannot suppose offspring to remember anything that happens to the parent subsequently to the parent's ceasing to contain the offspring within itself. From the average age, therefore, of reproduction, offspring should cease to have any farther steady, continuous memory to fall back upon; what memory there is should be full of faults, and as such unreliable. An organism ought to develop as long as it is backed by memory—that is to say, until the average age at which reproduction begins; it should then continue to go for a time on the impetus already received, and should eventually decay through failure of any memory to support it, and tell it what to do. This corresponds absolutely with what we observe in organisms generally, and explains, on the
one hand, why the age of puberty marks the beginning of completed development—a riddle hitherto not only unexplained but, so far as I have seen, unasked; it explains, on the other hand, the phenomena of old age—hitherto without even attempt at explanation.

Sixthly, those organisms that are the longest in reaching maturity should on the average be the longest-lived, for they will have received the most momentous impulse from the weight of memory behind them. This harmonises with the latest opinion as to the facts. In his article on Weismann in the Contemporary Review for May 1890, Mr. Romanes writes: "Professor Weismann has shown that there is throughout the metazoa a general correlation between the natural lifetime of individuals composing any given species, and the age at which they reach maturity or first become capable of procreation." This, I believe, has been the conclusion generally arrived at by biologists for some years past.

Lateness, then, in the average age of reproduction appears to be the principle underlying longevity. There does not appear at first sight to be much connection between such
Art and Science

distinct and apparently disconnected phenomena as 1, the orderly normal progress of development; 2, atavism and the resumption of feral characteristics; 3, the more ordinary resemblance *inter se* of nearer relatives; 4, the benefit of an occasional cross, and the usual sterility of hybrids; 5, the unconsciousness with which alike bodily development and ordinary physiological functions proceed, so long as they are normal; 6, the ordinary non-inheritance, but occasional inheritance of mutilations; 7, the fact that puberty indicates the approach of maturity; 8, the phenomena of middle life and old age; 9, the principle underlying longevity. These phenomena have no conceivable bearing on one another until heredity and memory are regarded as part of the same story. Identify these two things, and I know no phenomenon of heredity that does not immediately become infinitely more intelligible. Is it conceivable that a theory which harmonises so many facts hitherto regarded as without either connection or explanation should not deserve at any rate consideration from those who profess to take an interest in biology?
Essays on Life

It is not as though the theory were unknown, or had been condemned by our leading men of science. Professor Ray Lankester introduced it to English readers in an appreciative notice of Professor Hering's address, which appeared in *Nature*, July 13, 1876. He wrote to the *Athenæum*, March 24, 1884, and claimed credit for having done so, but I do not believe he has ever said more in public about it than what I have here referred to. Mr. Romanes did indeed try to crush it in *Nature*, January 27, 1881, but in 1883, in his "Mental Evolution in Animals," he adopted its main conclusion without acknowledgment. The *Athenæum*, to my unbounded surprise, called him to task for this (March 1, 1884), and since that time he has given the Heringian theory a sufficiently wide berth. Mr. Wallace showed himself favourably enough disposed towards the view that heredity and memory are part of the same story when he reviewed my book "Life and Habit" in *Nature*, March 27, 1879, but he has never since betrayed any sign of being aware that such a theory existed. Mr. Herbert Spencer wrote to the *Athenæum* (April 5, 1884), and claimed the theory for himself,
but, in spite of his doing this, he has never, that I have seen, referred to the matter again. I have dealt sufficiently with his claim in my book, "Luck or Cunning." Lastly, Professor Hering himself has never that I know of touched his own theory since the single short address read in 1870, and translated by me in 1881. Every one, even its originator, except myself, seems afraid to open his mouth about it. Of course the inference suggests itself that other people have more sense than I have. I readily admit it; but why have so many of our leaders shown such a strong hankering after the theory, if there is nothing in it?

The deadlock that I have pointed out as existing in Darwinism will, I doubt not, lead ere long to a consideration of Professor Hering's theory. English biologists are little likely to find Weismann satisfactory for long, and if he breaks down there is nothing left for them but Lamarck, supplemented by the important and elucidatory corollary on his theory proposed by Professor Hering. When the time arrives for this to obtain a hearing it will

1 Longmans, 1890.
be confirmed, doubtless, by arguments clearer and more forcible than any I have been able to adduce; I shall then be delighted to resign the championship which till then I shall continue, as for some years past, to have much pleasure in sustaining. Heretofore my satisfaction has mainly lain in the fact that more of our prominent men of science have seemed anxious to claim the theory than to refute it; in the confidence thus engendered I leave it to any fuller consideration which the outline I have above given may incline the reader to bestow upon it.

THE END
This book is due on the last date stamped below, or on the date to which renewed.
Renewed books are subject to immediate recall.
